

# Scan Report

October 23, 2025

## Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone “Coordinated Universal Time”, which is abbreviated “UTC”. The task was “unnamed”. The scan started at Thu Oct 23 00:33:30 2025 UTC and ended at Thu Oct 23 01:05:27 2025 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

## Contents

## Result Overview

Host	High	Medium	Low	Log	False Positive
<a href="#">172.17.0.3</a>	112	151	20	85	0
Total: 1	112	151	20	85	0

Vendor security updates are not trusted.

Overrides are on. When a result has an override, this report uses the threat of the override.

Information on overrides is included in the report.

Notes are included in the report.

This report might not show details of all issues that were found.

This report contains all 368 results selected by the filtering described above. Before filtering there were 368 results.

<b>High (CVSS: 7.5)</b> <b>NVT: Check for Backdoor in UnrealIRCd</b>
<b>Summary</b> Detection of backdoor in UnrealIRCd.
<b>Vulnerability Detection Result</b> Vulnerability was detected according to the Vulnerability Detection Method.
<b>Solution</b> <b>Solution type:</b> VendorFix Install latest version of unrealircd and check signatures of software you're installing.
<b>Vulnerability Insight</b> Remote attackers can exploit this issue to execute arbitrary system commands within the context of the affected application. The issue affects Unreal 3.2.8.1 for Linux. Reportedly package Unreal3.2.8.1.tar.gz downloaded in November 2009 and later is affected. The MD5 sum of the affected file is 752e46f2d873c1679fa99de3f52a274d. Files with MD5 sum of 7b741e94e867c0a7370553fd01506c66 are not affected.
<b>Vulnerability Detection Method</b> Details: Check for Backdoor in UnrealIRCd OID:1.3.6.1.4.1.25623.1.0.80111 Version used: \$Revision: 13960 \$

## High 6200/tcp

<b>High (CVSS: 7.5)</b> <b>NVT: vsftpd Compromised Source Packages Backdoor Vulnerability</b>
<b>Summary</b> vsftpd is prone to a backdoor vulnerability.
<b>Vulnerability Detection Result</b> Vulnerability was detected according to the Vulnerability Detection Method.
... continues on next page ...

...continued from previous page ...

**Impact**

Attackers can exploit this issue to execute arbitrary commands in the context of the application. Successful attacks will compromise the affected application.

**Solution**

**Solution type:** VendorFix

The repaired package can be downloaded from the referenced link. Please validate the package with its signature.

**Affected Software/OS**

The vsftpd 2.3.4 source package is affected.

**Vulnerability Detection Method**

Details: vsftpd Compromised Source Packages Backdoor Vulnerability

OID:1.3.6.1.4.1.25623.1.0.103185

Version used: \$Revision: 12076 \$

**High 2121/tcp**

High (CVSS: 10.0)

NVT: ProFTPD Multiple Remote Vulnerabilities

**Product detection result**

cpe:/a:proftpd:proftpd:1.3.1

Detected by ProFTPD Server Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.900815)

**Summary**

The host is running ProFTPD and is prone to multiple vulnerabilities.

**Vulnerability Detection Result**

Installed version: 1.3.1

Fixed version: 1.3.3c

... continues on next page ...

...continued from previous page ...
<b>Impact</b> Successful exploitation may allow execution of arbitrary code or cause a denial-of-service.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to ProFTPD version 1.3.3c or later.
<b>Affected Software/OS</b> ProFTPD versions prior to 1.3.3c
<b>Vulnerability Insight</b> - An input validation error within the 'mod_site_misc' module can be exploited to create and delete directories, create symlinks, and change the time of files located outside a writable directory. - A logic error within the 'pr_netio_telnet_gets()' function in 'src/netio.c' when processing user input containing the Telnet IAC escape sequence can be exploited to cause a stack-based buffer overflow by sending specially crafted input to the FTP or FTPS service.
<b>Vulnerability Detection Method</b> Details: ProFTPD Multiple Remote Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.801639 Version used: \$Revision: 13602 \$

... continues on next page ...

...continued from previous page...	
↔0.900815)	
<b>Summary</b> This host is running ProFTPD Server and is prone to remote SQL Injection vulnerability.	
<b>Vulnerability Detection Result</b> Installed version: 1.3.1 Fixed version: 1.3.2rc3	
<b>Impact</b> Successful exploitation will allow remote attackers to execute arbitrary SQL commands, thus gaining access to random user accounts.	
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to the latest version 1.3.2rc3.	
<b>Affected Software/OS</b> ProFTPD Server version 1.3.1 through 1.3.2rc2.	
<b>Vulnerability Insight</b> This flaw occurs because the server performs improper input sanitising, - when a %(percent) character is passed in the username, a single quote (') gets introduced during variable substitution by mod_sql and this eventually allows for an SQL injection during login. - when NLS support is enabled, a flaw in variable substitution feature in mod_sql_mysql and mod_sql_postgres may allow an attacker to bypass SQL injection protection mechanisms via invalid, encoded multibyte characters.	
<b>Vulnerability Detection Method</b> Details: ProFTPD Server SQL Injection Vulnerability OID:1.3.6.1.4.1.25623.1.0.900507 Version used: \$Revision: 13602 \$	
<b>Product Detection Result</b> Product: cpe:/a:proftpd:proftpd:1.3.1 Method: ProFTPD Server Version Detection (Remote) OID: 1.3.6.1.4.1.25623.1.0.900815)	
<b>References</b> CVE: CVE-2009-0542, CVE-2009-0543 BID:33722 Other: URL:http://www.milw0rm.com/exploits/8037 URL:http://www.securityfocus.com/archive/1/archive/1/500833/100/0/threaded URL:http://www.securityfocus.com/archive/1/archive/1/500851/100/0/threaded	

[\[ return to 172.17.0.3 \]](#)**High 512/tcp**

<b>High (CVSS: 10.0)</b> <b>NVT: rexec Passwordless / Unencrypted Cleartext Login</b>
<b>Summary</b> This remote host is running a rexec service.
<b>Vulnerability Detection Result</b> The rexec service is not allowing connections from this host.
<b>Solution</b> <b>Solution type:</b> Mitigation Disable the rexec service and use alternatives like SSH instead.
<b>Vulnerability Insight</b> rexec (Remote Process Execution) has the same kind of functionality that rsh has: you can execute shell commands on a remote computer. The main difference is that rexec authenticates by reading the username and password *unencrypted* from the socket.
<b>Vulnerability Detection Method</b> Details: rexec Passwordless / Unencrypted Cleartext Login OID:1.3.6.1.4.1.25623.1.0.100111 Version used: \$Revision: 13541 \$
<b>References</b> Other: URL: <a href="https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-1999-0618">https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-1999-0618</a>

[\[ return to 172.17.0.3 \]](#)**High 5900/tcp**

<b>High (CVSS: 9.0)</b> <b>NVT: VNC Brute Force Login</b>
<b>Summary</b> Try to log in with given passwords via VNC protocol.
<b>Vulnerability Detection Result</b> It was possible to connect to the VNC server with the password: password
... continues on next page ...

...continued from previous page ...

**Solution****Solution type:** Mitigation

Change the password to something hard to guess or enable password protection at all.

**Vulnerability Insight**

This script tries to authenticate to a VNC server with the passwords set in the password preference. It will also test and report if no authentication / password is required at all.

Note: Some VNC servers have a blacklisting scheme that blocks IP addresses after five unsuccessful connection attempts for a period of time. The script will abort the brute force attack if it encounters that it gets blocked.

Note as well that passwords can be max. 8 characters long.

**Vulnerability Detection Method**

<b>High (CVSS: 7.5)</b> <b>NVT: Apache HTTP Server Multiple Vulnerabilities June17 (Linux)</b>
<b>Product detection result</b> cpe:/a:apache:http_server:2.2.8 Detected by Apache Web Server Detection (OID: 1.3.6.1.4.1.25623.1.0.900498)
<b>Summary</b> This host is running Apache HTTP Server and is prone to multiple vulnerabilities.
<b>Vulnerability Detection Result</b> Installed version: 2.2.8 Fixed version: 2.2.33
<b>Impact</b> Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to Apache HTTP Server 2.2.33 or 2.4.26 or later.
<b>Affected Software/OS</b> ... continues on next page ...

...continued from previous page ...
Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26 on Linux.
<b>Vulnerability Insight</b> Multiple flaws exists as, - The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header. - The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port. - An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: Apache HTTP Server Multiple Vulnerabilities June17 (Linux) OID:1.3.6.1.4.1.25623.1.0.811214 Version used: \$Revision: 11863 \$

**High (CVSS: 7.5)****NVT: PHP 'shmop\_read()' Remote Integer Overflow Vulnerability****Product detection result**

cpe:/a:php:php:5.2.4

Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)

**Summary**

PHP is prone to an integer-overflow vulnerability because it fails to ensure that integer values are not overrun.

**Vulnerability Detection Result**

Installed version: 5.2.4

Fixed version: 5.3.6

**Impact**

Successful exploits of this vulnerability allow remote attackers to execute arbitrary code in the context of a webserver affected by the issue. Failed attempts will likely result in denial-of-service conditions.

**Solution****Solution type:** VendorFix

Updates are available. Please see the references for more information.

**Affected Software/OS**

Versions prior to PHP 5.3.6 are vulnerable.

**Vulnerability Detection Method**

Details: PHP 'shmop\_read()' Remote Integer Overflow Vulnerability

OID: 1.3.6.1.4.1.25623.1.0.103113

Version used: \$Revision: 10458 \$

**Product Detection Result**

Product: cpe:/a:php:php:5.2.4

Method: PHP Version Detection (Remote)

High (CVSS: 7.5) NVT: PHP < 5.2.13 Multiple Vulnerabilities
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> The remote web server has installed a PHP Version which is prone to Multiple Vulnerabilities.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.2.13
<b>Solution</b> <b>Solution type:</b> VendorFix Updates are available. Please see the references for details.
<b>Affected Software/OS</b>
... continues on next page ...

...continued from previous page ...
PHP versions prior to 5.2.13 are affected.
<b>Vulnerability Insight</b> Multiple vulnerabilities exist due to: <ol style="list-style-type: none"> <li>1. A 'safe_mode' restriction-bypass vulnerability. Successful exploits could allow an attacker to write session files in arbitrary directions.</li> <li>2. A 'safe_mode' restriction-bypass vulnerability. Successful exploits could allow an attacker to access files in unauthorized locations or create files in any writable directory.</li> <li>3. An unspecified security vulnerability that affects LCG entropy.</li> </ol>
<b>Vulnerability Detection Method</b> Details: PHP < 5.2.13 Multiple Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.100511 Version used: \$Revision: 13960 \$
<b>Product Detection Result</b> Product: cpe:/a:php:php:5.2.4 Method: PHP Version Detection (Remote) OID: 1.3.6.1.4.1.25623.1.0.800109)

High (CVSS: 7.5) NVT: PHP Arbitrary Code Execution Vulnerability - Aug16 (Linux)
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> This host is installed with PHP and is prone to arbitrary code execution vulnerability
... continues on next page ...

...continued from previous page ...
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.5.27
<b>Impact</b> Successfully exploiting this issue allow remote attackers to execute arbitrary code by triggering a failed SplMinHeap::compare operation.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to PHP version 5.5.27, or 5.6.11, or later.
<b>Affected Software/OS</b> PHP versions prior to 5.5.27 and 5.6.x before 5.6.11 on Linux.
<b>Vulnerability Insight</b> The flaw is due to Use-after-free vulnerability in the 'spl_ptr_heap_insert' function in 'ext/spl/spl_heap.c'.
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: PHP Arbitrary Code Execution Vulnerability - Aug16 (Linux) OID:1.3.6.1.4.1.25623.1.0.808671 Version used: \$Revision: 11903 \$

... continues on next page ...

...continued from previous page ...
Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> This host is installed with PHP and is prone to denial of service vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.5.28
<b>Impact</b> Successfully exploiting this issue allow remote attackers to cause a denial of service (race condition and heap memory corruption) by leveraging an application that performs many temporary-file accesses.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to PHP version 5.5.28, or 5.6.12, or later.
<b>Affected Software/OS</b> PHP versions prior to 5.5.28 and 5.6.x before 5.6.12 on Linux
<b>Vulnerability Insight</b> The flaw is due to script 'main/php_open_temporary_file.c' does not ensure thread safety.
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: PHP Denial of Service Vulnerability - 01 - Jul16 (Linux) OID:1.3.6.1.4.1.25623.1.0.808613 Version used: \$Revision: 14181 \$

<b>Other:</b> URL:http://www.php.net/ChangeLog-5.php URL:http://www.openwall.com/lists/oss-security/2016/03/16/20	
<b>High (CVSS: 10.0)</b> <b>NVT: PHP End Of Life Detection (Linux)</b>	
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)	
<b>Summary</b> The PHP version on the remote host has reached the end of life and should not be used anymore.	
<b>Vulnerability Detection Result</b> The "PHP" version on the remote host has reached the end of life. CPE: cpe:/a:php:php:5.2.4 Installed version: 5.2.4 EOL version: 5.2 EOL date: 2011-01-06	
<b>Impact</b> An end of life version of PHP is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.	
<b>Solution</b> <b>Solution type:</b> VendorFix Update the PHP version on the remote host to a still supported version.	
<b>Vulnerability Insight</b> Each release branch of PHP is fully supported for two years from its initial stable release. During this period, bugs and security issues that have been reported are fixed and are released in regular point releases. After this two year period of active support, each branch is then supported for an additional year for critical security issues only. Releases during this period are made on an as-needed basis: there may be multiple point releases, or none, depending on the number of reports. Once the three years of support are completed, the branch reaches its end of life and is no longer supported.	
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: PHP End Of Life Detection (Linux) OID:1.3.6.1.4.1.25623.1.0.105889 Version used: \$Revision: 12149 \$

<b>High (CVSS: 10.0)</b> <b>NVT: PHP Heap-based buffer overflow in 'mbstring' extension</b>
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> The host is running PHP and is prone to Buffer Overflow vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.2.7
<b>Impact</b> Successful exploitation could allow attackers to execute arbitrary code via a crafted string containing an HTML entity.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to version 5.2.7 or later.
<b>Affected Software/OS</b> PHP version 4.3.0 to 5.2.6 on all running platform.
<b>Vulnerability Insight</b> The flaw is due to error in mbfilter_htmlent.c file in the mbstring extension. These can be exploited via mb_convert_encoding, mb_check_encoding, mb_convert_variables, and mb_parse_str functions.
<b>Vulnerability Detection Method</b> Details: PHP Heap-based buffer overflow in 'mbstring' extension OID:1.3.6.1.4.1.25623.1.0.900185 Version used: \$Revision: 14010 \$

cpe:/a:php:php:5.2.4

Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)

**Summary**

This host is installed with PHP and is prone to multiple vulnerabilities.

**Vulnerability Detection Result**

Installed version: 5.2.4

Fixed version: 5.4.44

**Impact**

Successfully exploiting this issue allow remote attackers to execute arbitrary code and to create or overwrite arbitrary files on the system and this may lead to launch further attacks.

**Solution****Solution type:** VendorFix

Upgrade to PHP version 5.4.44 or 5.5.28 or 5.6.12 or later.

**Affected Software/OS**

PHP versions before 5.4.44, 5.5.x before 5.5.28, and 5.6.x before 5.6.12 on Linux

**Vulnerability Insight**

Multiple flaws are due to,

- The multiple use-after-free vulnerabilities in SPL unserialize implementation.
- An insufficient validation of user supplied input by 'phar/phar\_object.c' script.

**Vulnerability Detection Method**

Checks if a vulnerable version is present on the target host.

...continued from previous page ...	
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.4.42	
<b>Impact</b> Successfully exploiting this issue allow remote attackers to cause a denial of service, to read or write to arbitrary files, also execute arbitrary code via a long reply to a LIST command, leading to a heap-based buffer overflow.	
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to PHP version 5.4.42, or 5.5.26, or 5.6.10, or later.	
<b>Affected Software/OS</b> PHP versions prior to 5.4.42, 5.5.x before 5.5.26, and 5.6.x before 5.6.10 on Linux	
<b>Vulnerability Insight</b> The multiple flaws are due to, <ul style="list-style-type: none"> <li>- Improper validation of token extraction for table names, in the php_pgsql_meta_data function in pgsql.c in the PostgreSQL extension.</li> <li>- Integer overflow in the ftp_genlist function in ext/ftp/ftp.c</li> <li>- PHP does not ensure that pathnames lack %00 sequences.</li> </ul>	
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: PHP Multiple Vulnerabilities - 05 - Aug16 (Linux) OID:1.3.6.1.4.1.25623.1.0.808675 Version used: \$Revision: 12313 \$

<b>Summary</b> This host is installed with PHP and is prone to multiple security vulnerabilities.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.6.39 Installation
... continues on next page ...

...continued from previous page...	
path / port:	80/tcp
<b>Impact</b> Successful exploitation will allow remote attackers to execute remote code on the affected application/system and/or cause a denial of service.	
<b>Solution</b> <b>Solution type:</b> VendorFix Update to version 5.6.39, 7.0.33, 7.1.25, 7.2.13, 7.3.0 or later.	
<b>Affected Software/OS</b> PHP versions 5.x before 5.6.39, 7.0.x before 7.0.33, 7.1.x before 7.1.25 and 7.2.x before 7.2.13.	
<b>Vulnerability Insight</b> The flaws exist due to, - the imap_open functions which allows to run arbitrary shell commands via mailbox parameter. - a Heap Buffer Overflow (READ: 4) in phar_parse_pharfile. - ext/standard/var_unserializer.c allows attackers to cause a denial of service (application crash) via an unserialize call for the com, dotnet, or variant class.	
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: PHP Multiple Vulnerabilities - Dec18 (Linux) OID:1.3.6.1.4.1.25623.1.0.108507 Version used: 2019-03-29T15:39:23+0000

<b>High (CVSS: 7.5)</b> <b>NVT: PHP Multiple Vulnerabilities - Feb19 (Linux)</b>
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> PHP is prone to multiple vulnerabilities.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.6.40 Installation path / port: 80/tcp
<b>Solution</b> <b>Solution type:</b> VendorFix Update to version 5.6.40, 7.1.16, 7.2.14, 7.3.1 or later.
<b>Affected Software/OS</b> PHP versions before 5.6.40, 7.x before 7.1.26, 7.2.x before 7.2.14 and 7.3.x before 7.3.1.
<b>Vulnerability Insight</b> PHP is prone to multiple vulnerabilities: - Invalid input to the function xmlrpc_decode() can lead to an invalid memory access (heap out of bounds read or read after free). This is related to xml_elem_parse_buf in ext/xmlrpc/libxmlrpc/xml_element.c. (CVE-2019-9020) - A heap-based buffer over-read in PHAR reading functions in the PHAR extension may allow an attacker to read allocated or unallocated memory past the actual data when trying to parse the file name. (CVE-2019-9021) - A number of heap-based buffer over-read instances are present in mbstring regular expression functions when supplied with invalid multibyte data. (CVE-2019-9023) - xmlrpc_decode() can allow a hostile XMLRPC server to cause PHP to read memory outside of allocated areas (CVE-2019-9024)
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: PHP Multiple Vulnerabilities - Feb19 (Linux) OID:1.3.6.1.4.1.25623.1.0.142048 Version used: \$Revision: 13857 \$

High (CVSS: 7.5)

NVT: PHP Multiple Vulnerabilities - Sep09

**Product detection result**

cpe:/a:php:php:5.2.4

Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)

**Summary**

This host is running PHP and is prone to multiple vulnerabilities.

**Vulnerability Detection Result**

Installed version: 5.2.4

Fixed version: 5.2.11

**Impact**

Successful exploitation will allow attackers to spoof certificates and can cause unknown impacts in the context of the web application.

**Solution****Solution type:** VendorFix

Upgrade to version 5.2.11 or later.

**Affected Software/OS**

PHP version prior to 5.2.11

**Vulnerability Insight**

- An error in 'php\_openssl\_apply\_verification\_policy' function that does not properly perform certificate validation.
- An input validation error exists in the processing of 'exif' data.

... continues on next page ...

...continued from previous page ...
- An unspecified error exists related to the sanity check for the color index in the 'imagecolor-transparent' function.

<b>High (CVSS: 7.5)</b> <b>NVT: PHP-CGI-based setups vulnerability when parsing query string parameters from php files.</b>
<b>Summary</b> PHP is prone to an information-disclosure vulnerability.
<b>Vulnerability Detection Result</b> Vulnerable url: http://172.17.0.3/cgi-bin/php
<b>Impact</b> Exploiting this issue allows remote attackers to view the source code of files in the context of the server process. This may allow the attacker to obtain sensitive information and to run arbitrary PHP code on the affected computer. Other attacks are also possible.
<b>Solution</b> <b>Solution type:</b> VendorFix PHP has released version 5.4.3 and 5.3.13 to address this vulnerability. PHP is recommending that users upgrade to the latest version of PHP.
<b>Vulnerability Insight</b> When PHP is used in a CGI-based setup (such as Apache's mod_cgid), the php-cgi receives a processed query string parameter as command line arguments which allows command-line switches, such as -s, -d or -c to be passed to the php-cgi binary, which can be exploited to disclose source code and obtain arbitrary code execution. An example of the -s command, allowing an attacker to view the source code of index.php is below: http://example.com/index.php?-s
<b>Vulnerability Detection Method</b> Details: PHP-CGI-based setups vulnerability when parsing query string parameters from ph. ↪.. OID:1.3.6.1.4.1.25623.1.0.103482 Version used: \$Revision: 13679 \$

<b>High (CVSS: 7.5)</b> <b>NVT: phpinfo() output Reporting</b>
<b>Summary</b> Many PHP installation tutorials instruct the user to create a file called phpinfo.php or similar containing the phpinfo() statement. Such a file is often left back in the webserver directory.
<b>Vulnerability Detection Result</b> The following files are calling the function phpinfo() which disclose potentially sensitive information: <a href="http://172.17.0.3/mutillidae/phpinfo.php">http://172.17.0.3/mutillidae/phpinfo.php</a> <a href="http://172.17.0.3/phpinfo.php">http://172.17.0.3/phpinfo.php</a>
<b>Impact</b> Some of the information that can be gathered from this file includes: The username of the user running the PHP process, if it is a sudo user, the IP address of the host, the web server version, the system version (Unix, Linux, Windows, ...), and the root directory of the web server.
<b>Solution</b> <b>Solution type:</b> Workaround Delete the listed files or restrict access to them.
<b>Vulnerability Detection Method</b> Details: phpinfo() output Reporting OID:1.3.6.1.4.1.25623.1.0.11229 Version used: \$Revision: 11992 \$

<b>Summary</b> This host is running phpMyAdmin and is prone to multiple vulnerabilities.
... continues on next page ...

...continued from previous page ...
<b>Vulnerability Detection Result</b> Installed version: 3.1.1 Fixed version: 2.11.9.5/3.1.3.1
<b>Impact</b> Successful exploitation will let the attacker cause XSS, Directory Traversal attacks or can injection malicious PHP Codes to gain sensitive information about the remote host.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to version 2.11.9.5 or 3.1.3.1 or later.
<b>Affected Software/OS</b> phpMyAdmin version 2.11.x to 2.11.9.4 and 3.0.x to 3.1.3.
<b>Vulnerability Insight</b> Multiple flaws are due to, - BLOB streaming feature in 'bs_disp_as_mime_type.php' causes CRLF Injection which lets the attacker inject arbitrary data in the HTTP headers through the 'c_type' and 'file_type' parameters. - XSS Vulnerability in 'display_export.lib.php' as its not sanitizing the 'pma_db_filename_template' parameter. - Static code injection vulnerability in 'setup.php' which can be used to inject PHP Codes. - Filename 'bs_disp_as_mime_type.php' which is not sanitizing user supplied inputs in the filename variable which causes directory traversal attacks.
<b>Vulnerability Detection Method</b> Details: phpMyAdmin 2.11.x < 2.11.9.4 / 3.0.x < 3.1.3 Multiple Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.800381 Version used: \$Revision: 14031 \$

**High (CVSS: 7.5)****NVT: phpMyAdmin Code Injection and XSS Vulnerability****Product detection result**

cpe:/a:phpmyadmin:phpmyadmin:3.1.1

Detected by phpMyAdmin Detection (OID: 1.3.6.1.4.1.25623.1.0.900129)

**Summary**

phpMyAdmin is prone to a remote PHP code-injection vulnerability and to a cross-site scripting vulnerability.

**Vulnerability Detection Result**

Installed version: 3.1.1

Fixed version: 2.11.9.5 / 3.1.3.1

**Impact**

An attacker can exploit this issue to inject and execute arbitrary malicious PHP code in the context of the webserver process. This may facilitate a compromise of the application and the underlying system. Other attacks are also possible.

**Solution****Solution type:** VendorFix

Update to version 2.11.9.5 / 3.1.3.1 or later.

**Affected Software/OS**

Versions prior to phpMyAdmin 2.11.9.5 and 3.1.3.1 are vulnerable.

**Vulnerability Detection Method**

Details: phpMyAdmin Code Injection and XSS Vulnerability

cpe:/a:mysql:mysql:5.0.51a

Detected by MySQL/MariaDB Detection (OID: 1.3.6.1.4.1.25623.1.0.100152)

**Summary**

The host is running MySQL and is prone to Multiple Format String vulnerabilities.

**Vulnerability Detection Result**

Vulnerability was detected according to the Vulnerability Detection Method.

**Impact**

Successful exploitation could allow remote authenticated users to cause a Denial of Service and possibly have unspecified other attacks.

**Solution****Solution type:** VendorFixUpgrade to MySQL version 5.1.36 or later <http://dev.mysql.com/downloads>**Affected Software/OS**

MySQL version 4.0.0 to 5.0.83 on all running platform.

**Vulnerability Insight**

The flaws are due to error in the 'dispatch\_command' function in sql\_parse.cc in libmysqld/ which can caused via format string specifiers in a database name in a 'COM\_CREATE\_DB' or 'COM\_DROP\_DB' request.

**Vulnerability Detection Method**

Details: MySQL 'sql\_parse.cc' Multiple Format String Vulnerabilities

Other:

URL:<http://www.securityfocus.com/bid/65230>

URL:<http://www.openssh.com>

High (CVSS: 7.8)

NVT: OpenSSH Denial of Service And User Enumeration Vulnerabilities (Linux)

#### Product detection result

cpe:/a:openbsd:openssh:4.7p1

Detected by SSH Server type and version (OID: 1.3.6.1.4.1.25623.1.0.10267)

#### Summary

This host is installed with openssh and is prone to denial of service and user enumeration vulnerabilities.

#### Vulnerability Detection Result

Installed version: 4.7p1

Fixed version: 7.3

#### Impact

Successfully exploiting this issue allows remote attackers to cause a denial of service (crypt CPU consumption) and to enumerate users by leveraging the timing difference between responses when a large password is provided.

#### Solution

**Solution type:** VendorFix

Upgrade to OpenSSH version 7.3 or later.

#### Affected Software/OS

OpenSSH versions before 7.3 on Linux

#### Vulnerability Insight

Multiple flaws exist due to,

- The auth\_password function in 'auth-passwd.c' script does not limit password lengths for password authentication.
- The sshd in OpenSSH, when SHA256 or SHA512 are used for user password hashing uses BLOWFISH hashing on a static password when the username does not exist and it takes much longer to calculate SHA256/SHA512 hash than BLOWFISH hash.

#### Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

NVT: OpenSSH X11 Forwarding Security Bypass Vulnerability (Linux)

**Product detection result**

cpe:/a:openbsd:openssh:4.7p1

Detected by SSH Server type and version (OID: 1.3.6.1.4.1.25623.1.0.10267)

... continues on next page ...

...continued from previous page ...
<b>Summary</b> This host is installed with openssh and is prone to security bypass vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 4.7p1 Fixed version: 7.2
<b>Impact</b> Successfully exploiting this issue allows local users to bypass certain security restrictions and perform unauthorized actions. This may lead to further attacks.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to OpenSSH version 7.2 or later.
<b>Affected Software/OS</b> OpenSSH versions before 7.2 on Linux.
<b>Vulnerability Insight</b> An access flaw was discovered in OpenSSH, It did not correctly handle failures to generate authentication cookies for untrusted X11 forwarding. A malicious or compromised remote X application could possibly use this flaw to establish a trusted connection to the local X server, even if only untrusted X11 forwarding was requested.
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: OpenSSH X11 Forwarding Security Bypass Vulnerability (Linux) OID:1.3.6.1.4.1.25623.1.0.810769 Version used: \$Revision: 11816 \$
<b>Product Detection Result</b> Product: cpe:/a:openbsd:openssh:4.7p1 Method: SSH Server type and version OID: 1.3.6.1.4.1.25623.1.0.10267)

High (CVSS: 7.5)

NVT: SSH Brute Force Logins With Default Credentials Reporting

**Summary**

It was possible to login into the remote SSH server using default credentials.

As the NVT 'SSH Brute Force Logins with default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108013) might run into a timeout the actual reporting of this vulnerability takes place in this NVT instead. The script preference 'Report timeout' allows you to configure if such an timeout is reported.

**Vulnerability Detection Result**

It was possible to login with the following credentials <User>:<Password>

msfadmin:msfadmin

user:user

**Solution**

**Solution type:** Mitigation

Change the password as soon as possible.

**Vulnerability Detection Method**

Try to login with a number of known default credentials via the SSH protocol.

Details: SSH Brute Force Logins With Default Credentials Reporting

NVT: PostgreSQL &lt; 10.6, 11.x &lt; 11.1 SQL Injection Vulnerability (Linux)

**Product detection result**

cpe:/a:postgresql:postgresql:8.3.1

Detected by PostgreSQL Detection (OID: 1.3.6.1.4.1.25623.1.0.100151)

**Summary**

PostgreSQL is prone to an SQL injection vulnerability.

**Vulnerability Detection Result**

Installed version: 8.3.1

... continues on next page ...

...continued from previous page ...	
<b>Fixed version:</b>	10.6
<b>Solution</b> <b>Solution type:</b> VendorFix Update to version 10.6 or 11.1 respectively.	
<b>Affected Software/OS</b> PostgreSQL before versions 10.6 and 11.1.	
<b>Vulnerability Insight</b> A SQL Injection flaw has been discovered in PostgreSQL server in the way triggers that enable transition relations are dumped. The transition relation name is not correctly quoted and it may allow an attacker with CREATE privilege on some non-temporary schema or TRIGGER privilege on some table to create a malicious trigger that, when dumped and restored, would result in additional SQL statements being executed.	
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: PostgreSQL < 10.6, 11.x < 11.1 SQL Injection Vulnerability (Linux) OID:1.3.6.1.4.1.25623.1.0.112429 Version used: \$Revision: 12858 \$

### High 513/tcp

<b>High (CVSS: 7.5)</b> <b>NVT: rlogin Passwordless / Unencrypted Cleartext Login</b>
<b>Summary</b> ... continues on next page ...

...continued from previous page ...
This remote host is running a rlogin service.
<b>Vulnerability Detection Result</b> The service is misconfigured so it is allowing connections without a password.
<b>Solution</b> <b>Solution type:</b> Mitigation Disable the rlogin service and use alternatives like SSH instead.
<b>Vulnerability Insight</b> rlogin has several serious security problems, - all information, including passwords, is transmitted unencrypted. - .rlogin (or .rhosts) file is easy to misuse (potentially allowing anyone to login without a password)
<b>Vulnerability Detection Method</b> Details: rlogin Passwordless / Unencrypted Cleartext Login OID:1.3.6.1.4.1.25623.1.0.901202 Version used: \$Revision: 13541 \$

[\[ return to 172.17.0.3 \]](#)

High 8787/tcp

High (CVSS: 10.0) NVT: Distributed Ruby (dRuby/DRb) Multiple Remote Code Execution Vulnerabilities
<b>Summary</b> Systems using Distributed Ruby (dRuby/DRb), which is available in Ruby versions 1.6 and later, may permit unauthorized systems to execute distributed commands.
<b>Vulnerability Detection Result</b> The service is running in \$SAFE >= 1 mode. However it is still possible to run a ↵rbbitrary syscall commands on the remote host. Sending an invalid syscall the s ↵ervice returned the following response: Flo:Errno::ENOSYS:bt["3/usr/lib/ruby/1.8/drb/drb.rb:1555:in 'syscall'"0/usr/lib/ ↵ruby/1.8/drb/drb.rb:1555:in 'send'"4/usr/lib/ruby/1.8/drb/drb.rb:1555:in '__se ↵nd__'"A/usr/lib/ruby/1.8/drb/drb.rb:1555:in 'perform_without_block'"3/usr/lib/ ↵ruby/1.8/drb/drb.rb:1515:in 'perform'"5/usr/lib/ruby/1.8/drb/drb.rb:1589:in 'm ↵ain_loop'"0/usr/lib/ruby/1.8/drb/drb.rb:1585:in 'loop'"5/usr/lib/ruby/1.8/drb/ ↵drb.rb:1585:in 'main_loop'"1/usr/lib/ruby/1.8/drb/drb.rb:1581:in 'start'"5/usr ↵/lib/ruby/1.8/drb/drb.rb:1581:in 'main_loop'"/usr/lib/ruby/1.8/drb/drb.rb:143 ↵0:in 'run'"1/usr/lib/ruby/1.8/drb/drb.rb:1427:in 'start'"/usr/lib/ruby/1.8/dr ↵b/drb.rb:1427:in 'run'"6/usr/lib/ruby/1.8/drb/drb.rb:1347:in 'initialize'"/us ↵r/lib/ruby/1.8/drb/drb.rb:1627:in 'new'"9/usr/lib/ruby/1.8/drb/drb.rb:1627:in ↵'start_service'"/usr/sbin/druby_timeserver.rb:12:errnoi+:mesg"Function not im ↵plemented
<b>Impact</b> By default, Distributed Ruby does not impose restrictions on allowed hosts or set the \$SAFE environment variable to prevent privileged activities. If other controls are not in place, especially if the Distributed Ruby process runs with elevated privileges, an attacker could execute arbitrary system commands or Ruby scripts on the Distributed Ruby server. An attacker may need to know only the URI of the listening Distributed Ruby server to submit Ruby commands.
<b>Solution</b> ... continues on next page ...

...continued from previous page ...
<b>Solution type:</b> Mitigation Administrators of environments that rely on Distributed Ruby should ensure that appropriate controls are in place. Code-level controls may include: <ul style="list-style-type: none"> <li>- Implementing taint on untrusted input</li> <li>- Setting \$SAFE levels appropriately (<math>\geq 2</math> is recommended if untrusted hosts are allowed to submit Ruby commands, and <math>\geq 3</math> may be appropriate)</li> <li>- Including drb/acl.rb to set ACLEntry to restrict access to trusted hosts</li> </ul>
<b>Vulnerability Detection Method</b> Send a crafted command to the service and check for a remote command execution via the instance_eval or syscall requests. Details: Distributed Ruby (dRuby/DRb) Multiple Remote Code Execution Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.108010 Version used: \$Revision: 12338 \$

NVT: Apache HTTP Server 'httpOnly' Cookie Information Disclosure Vulnerability

**Summary**

This host is running Apache HTTP Server and is prone to cookie information disclosure vulnerability.

**Vulnerability Detection Result**

Vulnerability was detected according to the Vulnerability Detection Method.

**Impact**

Successful exploitation will allow attackers to obtain sensitive information that may aid in further attacks.

**Solution**

**Solution type:** VendorFix

Upgrade to Apache HTTP Server version 2.2.22 or later.

**Affected Software/OS**

Apache HTTP Server versions 2.2.0 through 2.2.21

**Vulnerability Insight**

The flaw is due to an error within the default error response for status code 400 when no custom ErrorDocument is configured, which can be exploited to expose 'httpOnly' cookies.

**Vulnerability Detection Method**

Details: Apache HTTP Server 'httpOnly' Cookie Information Disclosure Vulnerability

Medium (CVSS: 5.0) NVT: Apache HTTP Server Mod_Lua Denial of service Vulnerability -01 May15
<b>Product detection result</b> cpe:/a:apache:http_server:2.2.8 Detected by Apache Web Server Detection (OID: 1.3.6.1.4.1.25623.1.0.900498)
<b>Summary</b> This host is installed with Apache HTTP Server and is prone to denial of service vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 2.2.8 Fixed version: 2.4.13
<b>Impact</b> Successful exploitation will allow a remote attackers to cause a denial of service via some crafted dimension.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to version 2.4.13 or later.
<b>Affected Software/OS</b> Apache HTTP Server versions through 2.4.12.
<b>Vulnerability Insight</b> Flaw is due to vulnerability in lua_websocket_read function in lua_request.c in the mod_lua module.

Medium (CVSS: 5.0) NVT: Apache HTTP Server OPTIONS Memory Leak Vulnerability (Optionsbleed)
<b>Product detection result</b> cpe:/a:apache:http_server:2.2.8 Detected by Apache Web Server Detection (OID: 1.3.6.1.4.1.25623.1.0.900498)
<b>Summary</b> Apache HTTP server allows remote attackers to read secret data from process memory if the Limit directive can be set in a user's .htaccess file, or if httpd.conf has certain misconfigurations, aka Optionsbleed.
<b>Vulnerability Detection Result</b> Installed version: 2.2.8 Fixed version:     Apply the referenced patch or upgrade to 2.4.28
<b>Impact</b> The successful exploitation allows the attacker to read chunks of the host's memory.
<b>Solution</b> <b>Solution type:</b> VendorFix Update to Apache HTTP Server 2.4.28. For Apache HTTP Server running version 2.2.34 apply the patch linked in the references.
... continues on next page ...

...continued from previous page ...
As a workaround the usage of .htaccess should be disabled competely via the 'AllowOverride None' directive within the webservers configuration. Furthermore all <Limit> statements within the webserver configuration needs to be verified for invalid HTTP methods.
<b>Affected Software/OS</b> Apache HTTP Server 2.2.x versions up to 2.2.34 and 2.4.x below 2.4.28.
<b>Vulnerability Insight</b> Optionsbleed is a use after free error in Apache HTTP server that causes a corrupted Allow header to be constructed in response to HTTP OPTIONS requests. This can leak pieces of arbitrary memory from the server process that may contain secrets. The memory pieces change after multiple requests, so for a vulnerable host an arbitrary number of memory chunks can be leaked. The bug appears if a webmaster tries to use the 'Limit' directive with an invalid HTTP method. Example .htaccess: <Limit abcxzy> </Limit>
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: Apache HTTP Server OPTIONS Memory Leak Vulnerability (Optionsbleed) OID:1.3.6.1.4.1.25623.1.0.108252 Version used: \$Revision: 11983 \$

Medium (CVSS: 5.0)

NVT: awiki Multiple Local File Include Vulnerabilities

**Summary**

awiki is prone to multiple local file-include vulnerabilities because it fails to properly sanitize user-supplied input.

**Vulnerability Detection Result**

Vulnerable url: <http://172.17.0.3/mutillidae/index.php?page=/etc/passwd>

**Impact**

An attacker can exploit this vulnerability to obtain potentially sensitive information and execute arbitrary local scripts in the context of the webserver process. This may allow the attacker to compromise the application and the host. Other attacks are also possible.

**Solution**

**Solution type:** WillNotFix

No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

**Affected Software/OS**

awiki 20100125 is vulnerable. Other versions may also be affected.

**Vulnerability Detection Method**

Details: awiki Multiple Local File Include Vulnerabilities

OID:1.3.6.1.4.1.25623.1.0.103210

Version used: \$Revision: 10741 \$

Medium (CVSS: 4.8)

NVT: Cleartext Transmission of Sensitive Information via HTTP

**Summary**

The host / application transmits sensitive information (username, passwords) in cleartext via HTTP.

**Vulnerability Detection Result**

The following input fields were identified (URL:input name):

[http://172.17.0.3/phpMyAdmin/:pma\\_password](http://172.17.0.3/phpMyAdmin/:pma_password)

[http://172.17.0.3/phpMyAdmin/?D=A:pma\\_password](http://172.17.0.3/phpMyAdmin/?D=A:pma_password)

<http://172.17.0.3/tikiwiki/tiki-install.php:pass>

<http://172.17.0.3/twiki/bin/view/TWiki/TWikiUserAuthentication:oldpassword>

**Impact**

An attacker could use this situation to compromise or eavesdrop on the HTTP communication between the client and the server using a man-in-the-middle attack to get access to sensitive data like usernames or passwords.

**Solution**

**Solution type:** Workaround

Enforce the transmission of sensitive data via an encrypted SSL/TLS connection. Additionally make sure the host / application is redirecting all users to the secured SSL/TLS connection before allowing to input sensitive data into the mentioned functions.

**Affected Software/OS**

Hosts / applications which doesn't enforce the transmission of sensitive data via an encrypted SSL/TLS connection.

**Vulnerability Detection Method**

Evaluate previous collected information and check if the host / application is not enforcing the transmission of sensitive data via an encrypted SSL/TLS connection.

The script is currently checking the following:

- HTTP Basic Authentication (Basic Auth)

- HTTP Forms (e.g. Login) with input field of type 'password'

Details: Cleartext Transmission of Sensitive Information via HTTP

Medium (CVSS: 5.0) NVT: Enabled Directory Listing Detection
<b>Summary</b> The script attempts to identify directories with an enabled directory listing.
<b>Vulnerability Detection Result</b> The following directories with an enabled directory listing were identified: http://172.17.0.3/dav http://172.17.0.3/doc http://172.17.0.3/mutillidae/documentation http://172.17.0.3/test http://172.17.0.3/test/testoutput Please review the content manually.
<b>Impact</b> Based on the information shown an attacker might be able to gather additional info about the structure of this application.
<b>Solution</b> <b>Solution type:</b> Mitigation If not needed disable the directory listing within the webservers config.
<b>Affected Software/OS</b> Webservers with an enabled directory listing.
<b>Vulnerability Detection Method</b> Check the detected directories if a directory listing is enabled. Details: Enabled Directory Listing Detection OID:1.3.6.1.4.1.25623.1.0.111074 Version used: \$Revision: 5440 \$
<b>References</b> Other: URL: <a href="https://www.owasp.org/index.php/OWASP_Periodic_Table_of_Vulnerabilities_-_Directory_Indexing">https://www.owasp.org/index.php/OWASP_Periodic_Table_of_Vulnerabilities_-_Directory_Indexing</a>

Medium (CVSS: 5.8) NVT: HTTP Debugging Methods (TRACE/TRACK) Enabled
<b>Summary</b> Debugging functions are enabled on the remote web server. The remote web server supports the TRACE and/or TRACK methods. TRACE and TRACK are HTTP methods which are used to debug web server connections.
<b>Vulnerability Detection Result</b> The web server has the following HTTP methods enabled: TRACE ... continues on next page ...

...continued from previous page ...
<b>Impact</b> An attacker may use this flaw to trick your legitimate web users to give him their credentials.
<b>Solution</b> <b>Solution type:</b> Mitigation Disable the TRACE and TRACK methods in your web server configuration. Please see the manual of your web server or the references for more information.
<b>Affected Software/OS</b> Web servers with enabled TRACE and/or TRACK methods.
<b>Vulnerability Insight</b> It has been shown that web servers supporting this methods are subject to cross-site-scripting attacks, dubbed XST for Cross-Site-Tracing, when used in conjunction with various weaknesses in browsers.

cpe:/a:php:php:5.2.4	
Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)	
<b>Summary</b>	
This host is running PHP and is prone to a stack consumption vulnerability	
<b>Vulnerability Detection Result</b>	
Installed version: 5.2.4	
Fixed version: 5.2.15/5.3.4	
<b>Impact</b>	
Successful exploitation could allow remote attackers to cause a denial of service (memory consumption and application crash) via a long e-mail address string.	
<b>Solution</b>	
<b>Solution type:</b> VendorFix	
Upgrade to PHP version 5.2.15/5.3.4 or later.	
<b>Affected Software/OS</b>	
PHP version 5.2 through 5.2.14 and 5.3 through 5.3.3	
<b>Vulnerability Insight</b>	
- The flaw exists due to an error in 'filter_var()' function, when FILTER_VALIDATE_EMAIL mode is used while processing the long e-mail address string.	
- A NULL pointer dereference vulnerability exists in 'ZipArchive::getArchiveComment'.	
<b>Vulnerability Detection Method</b>

Medium (CVSS: 5.0) NVT: PHP 'imageRotate()' Memory Information Disclosure Vulnerability
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> The host is running PHP and is prone to Memory Information Disclosure vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.2.9
<b>Impact</b> Successful exploitation could let the attacker read the contents of arbitrary memory locations through a crafted value for an indexed image.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to PHP version 5.2.9 or later.
<b>Affected Software/OS</b> PHP version 5.x to 5.2.8 on all running platform.
<b>Vulnerability Insight</b> The flaw is due to improper validation of bgd_color or clrBack argument in imageRotate function.
<b>Vulnerability Detection Method</b> Details: PHP 'imageRotate()' Memory Information Disclosure Vulnerability OID:1.3.6.1.4.1.25623.1.0.900186 Version used: \$Revision: 14010 \$
<b>Product Detection Result</b> Product: cpe:/a:php:php:5.2.4 Method: PHP Version Detection (Remote) OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>References</b> CVE: CVE-2008-5498 BID:33002 Other: URL: <a href="http://securitytracker.com/alerts/2008/Dec/1021494.html">http://securitytracker.com/alerts/2008/Dec/1021494.html</a> URL: <a href="http://downloads.securityfocus.com/vulnerabilities/exploits/33002.php">http://downloads.securityfocus.com/vulnerabilities/exploits/33002.php</a> URL: <a href="http://downloads.securityfocus.com/vulnerabilities/exploits/33002-2.php">http://downloads.securityfocus.com/vulnerabilities/exploits/33002-2.php</a>

<p>Medium (CVSS: 4.3)  NVT: PHP 'LibGD' Denial of Service Vulnerability</p>
<p><b>Product detection result</b>  cpe:/a:php:php:5.2.4  Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)</p>
<p><b>Summary</b>  This host is installed with PHP and is prone to denial of service vulnerability.</p>
<p><b>Vulnerability Detection Result</b>  Installed version: 5.2.4  Fixed version: 5.4.32/5.5.16/5.6.0</p>
<p><b>Impact</b>  Successful exploitation will allow remote attackers to conduct denial of service attacks.</p>
<p><b>Solution</b>  <b>Solution type:</b> VendorFix  Upgrade to PHP version 5.4.32 or 5.5.16 or 5.6.0 or later.</p>
<p><b>Affected Software/OS</b>  PHP version 5.x through 5.4.26 and probably other versions.</p>
<p><b>Vulnerability Insight</b>  The flaw is due to a NULL pointer dereference error in 'gdImageCreateFromXpm' function within LibGD.</p>
<p><b>Vulnerability Detection Method</b>  Checks if a vulnerable version is present on the target host.  Details: PHP 'LibGD' Denial of Service Vulnerability  OID:1.3.6.1.4.1.25623.1.0.804292  Version used: \$Revision: 11867 \$</p>
<p><b>Product Detection Result</b>  Product: cpe:/a:php:php:5.2.4  Method: PHP Version Detection (Remote)  OID: 1.3.6.1.4.1.25623.1.0.800109)</p>

Medium (CVSS: 6.4) NVT: PHP 'make_http_soap_request' Information Disclosure Vulnerability (Linux)
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> This host is installed with PHP and is prone to denial of service or information disclosure vulnerabilities
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.4.44
<b>Impact</b> Successfully exploiting this issue allow remote attackers to obtain sensitive information from process memory or cause a denial of service.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to PHP version 5.4.44, or 5.5.28, or 5.6.12, or 7.0.4, or later.
<b>Affected Software/OS</b> PHP versions prior to 5.4.44, 5.5.x before 5.5.28, 5.6.x before 5.6.12, and 7.x before 7.0.4 on Linux
<b>Vulnerability Insight</b> The flaw is due an error in the 'make_http_soap_request' function in 'ext/soap/php_http.c' script.
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: PHP 'make_http_soap_request' Information Disclosure Vulnerability (Linux) OID:1.3.6.1.4.1.25623.1.0.808666 Version used: \$Revision: 12051 \$
<b>Product Detection Result</b> Product: cpe:/a:php:php:5.2.4 Method: PHP Version Detection (Remote) OID: 1.3.6.1.4.1.25623.1.0.800109)

Medium (CVSS: 5.0)

NVT: PHP 'mb\_strcut()' Function Information Disclosure Vulnerability

**Product detection result**

cpe:/a:php:php:5.2.4

Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)

**Summary**

PHP is prone to an information-disclosure vulnerability.

**Vulnerability Detection Result**

Installed version: 5.2.4

Fixed version: 5.3.4

**Impact**

Attackers can exploit this issue to obtain sensitive information that may lead to further attacks.

**Solution****Solution type:** VendorFix

Updates are available. Please see the references for more information.

**Affected Software/OS**

Versions prior to PHP 5.3.4 are vulnerable.

**Vulnerability Detection Method**

Details: PHP 'mb\_strcut()' Function Information Disclosure Vulnerability

OID:1.3.6.1.4.1.25623.1.0.100898

Version used: \$Revision: 10459 \$

**Product Detection Result**

Product: cpe:/a:php:php:5.2.4

Method: PHP Version Detection (Remote)

OID: 1.3.6.1.4.1.25623.1.0.800109)

**References**

Medium (CVSS: 4.3) NVT: PHP 'PHAR' Error Page Reflected XSS And DoS Vulnerabilities (Linux)
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> This host is installed with PHP and is prone to cross site scripting and denial of service vulnerabilities.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.6.33 Installation path / port: 80/tcp
<b>Impact</b> Successfully exploiting this issue allows attacker to execute arbitrary script code in the browser of an unsuspecting user in the context of the affected site. This may allow the attacker to steal cookie-based authentication credentials and to launch other attacks and will also lead to a denial of service and exhausting the server resources.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to PHP version 5.6.33, 7.0.27, 7.1.13 or 7.2.1 or later.
<b>Affected Software/OS</b> PHP versions before 5.6.33, 7.0.x before 7.0.27, 7.1.x before 7.1.13, and 7.2.x before 7.2.1
<b>Vulnerability Insight</b> Multiple flaws are due to, - An input validation error on the PHAR 404 error page via the URI of a request for a .phar file. - An integer signedness error in gd_gif_in.c in the GD Graphics Library (aka libgd).
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: PHP 'PHAR' Error Page Reflected XSS And DoS Vulnerabilities (Linux) OID:1.3.6.1.4.1.25623.1.0.812735 Version used: \$Revision: 12120 \$
<b>Product Detection Result</b> Product: cpe:/a:php:php:5.2.4 Method: PHP Version Detection (Remote) OID: 1.3.6.1.4.1.25623.1.0.800109)

Medium (CVSS: 6.4)

NVT: PHP 'phar\_parse\_pharfile' Function Denial of Service Vulnerability - (Linux)

**Product detection result**

cpe:/a:php:php:5.2.4

Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)

**Summary**

This host is installed with PHP and is prone to denial of service vulnerability.

**Vulnerability Detection Result**

Installed version: 5.2.4

Fixed version: 5.6.30

**Impact**

Successfully exploiting this issue allow remote attackers to supply malicious archive files to crash the PHP interpreter or potentially disclose information.

**Solution****Solution type:** VendorFix

Upgrade to PHP version 5.6.30 or 7.0.15, or later.

**Affected Software/OS**

PHP versions before 5.6.30, 7.x before 7.0.15

**Vulnerability Insight**

The flaw exists due to a buffer over-read error in the 'phar\_parse\_pharfile' function in ext/phar/phar.c script.

**Vulnerability Detection Method**

Checks if a vulnerable version is present on the target host.

Details: PHP 'phar\_parse\_pharfile' Function Denial of Service Vulnerability - (Linux)

OID: 1.3.6.1.4.1.25623.1.0.811484

Medium (CVSS: 6.8) NVT: PHP 'PHP-FPM' Denial of Service Vulnerability (Linux)
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> This host is installed with PHP and is prone to denial of service vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 7.1.20 Installation path / port: 80/tcp
<b>Impact</b> Successfully exploitation will allow an attackers to consume 100% of the CPU, and consume disk space with a large volume of error logs, as demonstrated by an attack by a customer of a shared-hosting facility.
<b>Solution</b> <b>Solution type:</b> VendorFix Update to PHP 7.1.20, 7.2.8 or 7.3.0alpha3.
<b>Affected Software/OS</b> PHP versions 5.x up to and including 5.6.36. All 7.0.x versions, 7.1.x before 7.1.20, 7.2.x before 7.2.8 and 7.3.x before 7.3.0alpha3 on Windows.
<b>Vulnerability Insight</b> The flaw exist due to the php-fpm master process restarts a child process in an endless loop when using program execution functions with a non-blocking STDIN stream.

Medium (CVSS: 6.8) NVT: PHP 'xml_utf8_decode()' UTF-8 Input Validation Vulnerability
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
... continues on next page ...

...continued from previous page...	
<b>Summary</b>	PHP is prone to a vulnerability because it fails to sufficiently sanitize user-supplied input.
<b>Vulnerability Detection Result</b>	Installed version: 5.2.4 Fixed version: 5.3.4
<b>Impact</b>	Exploiting this issue can allow attackers to provide unexpected input and possibly bypass input-validation protection mechanisms. This can aid in further attacks that may utilize crafted user-supplied input.
<b>Solution</b>	<b>Solution type:</b> VendorFix Updates are available. Please see the references for more information.
<b>Affected Software/OS</b>	Versions prior to PHP 5.3.4 are vulnerable.
<b>Vulnerability Detection Method</b>	Details: PHP 'xml_utf8_decode()' UTF-8 Input Validation Vulnerability OID:1.3.6.1.4.1.25623.1.0.100901 Version used: \$Revision: 10459 \$
<b>Product Detection Result</b>	Product: cpe:/a:php:php:5.2.4 Method: PHP Version Detection (Remote) OID: 1.3.6.1.4.1.25623.1.0.800109)

Medium (CVSS: 5.0) NVT: PHP 'zend_strtod()' Function Floating-Point Value Denial of Service Vulnerability	
<b>Product detection result</b>	cpe:/a:php:php:5.2.4
... continues on next page ...	

...continued from previous page ...
Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> PHP is prone to a remote denial-of-service vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.2.17/5.3.5
<b>Impact</b> Successful attacks will cause applications written in PHP to hang, creating a denial-of-service condition.
<b>Solution</b> <b>Solution type:</b> VendorFix Updates are available. Please see the references for more details.
<b>Affected Software/OS</b> PHP 5.3.3 is vulnerable. Other versions may also be affected.
<b>Vulnerability Insight</b> The vulnerability is due to the Floating-Point Value that exist in zend_strtod function
<b>Vulnerability Detection Method</b> Details: PHP 'zend_strtod()' Function Floating-Point Value Denial of Service Vulnerability. ↪... OID:1.3.6.1.4.1.25623.1.0.103020 Version used: \$Revision: 10458 \$

Medium (CVSS: 5.0) NVT: PHP 5.2.8 and Prior Versions Multiple Vulnerabilities
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> PHP is prone to multiple security vulnerabilities.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.2.9
<b>Impact</b> Successful exploits could allow an attacker to cause a denial-of-service condition. An unspecified issue with an unknown impact was also reported.
<b>Solution</b> <b>Solution type:</b> VendorFix The vendor has released PHP 5.2.9 to address these issues.
<b>Affected Software/OS</b> These issues affect PHP 5.2.8 and prior versions.
<b>Vulnerability Detection Method</b> Details: PHP 5.2.8 and Prior Versions Multiple Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.100146 Version used: \$Revision: 14031 \$
<b>Product Detection Result</b> Product: cpe:/a:php:php:5.2.4 Method: PHP Version Detection (Remote) OID: 1.3.6.1.4.1.25623.1.0.800109)

Medium (CVSS: 5.0) NVT: PHP CDF File Parsing Denial of Service Vulnerabilities - 01 - Jun14
... continues on next page ...

...continued from previous page ...
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> This host is installed with PHP and is prone to denial of service vulnerabilities.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.4.29/5.5.13
<b>Impact</b> Successful exploitation will allow remote attackers to conduct denial of service attacks.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to PHP version 5.4.29 or 5.5.13 or later.
<b>Affected Software/OS</b> PHP version 5.x before 5.4.29 and 5.5.x before 5.5.13
<b>Vulnerability Insight</b> The flaw is due to - An error due to an infinite loop within the 'unpack_summary_info' function in src/cdf.c script. - An error within the 'cdf_read_property_info' function in src/cdf.c script.
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: PHP CDF File Parsing Denial of Service Vulnerabilities - 01 - Jun14 OID:1.3.6.1.4.1.25623.1.0.804639 Version used: \$Revision: 11867 \$
<b>Product Detection Result</b> Product: cpe:/a:php:php:5.2.4 Method: PHP Version Detection (Remote) OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>References</b> CVE: CVE-2014-0237, CVE-2014-0238 BID:67759, 67765 Other: URL:http://www.php.net/ChangeLog-5.php URL:http://secunia.com/advisories/58804 URL:https://www.hkcert.org/my_url/en/alert/14060401 URL:http://php.net

<p>Medium (CVSS: 4.3)  NVT: PHP Cross-Site Scripting Vulnerability - Aug16 (Linux)</p>
<p><b>Product detection result</b>  cpe:/a:php:php:5.2.4  Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)</p>
<p><b>Summary</b>  This host is installed with PHP and is prone to cross-site scripting (XSS) vulnerability.</p>
<p><b>Vulnerability Detection Result</b>  Installed version: 5.2.4  Fixed version: 5.4.38</p>
<p><b>Impact</b>  Successfully exploiting this issue allows remote attackers to conduct cross-site scripting (XSS) attacks against Internet Explorer by leveraging '%0A%20' or '%0D%0A%20' mishandling in the header function.</p>
<p><b>Solution</b>  <b>Solution type:</b> VendorFix  Upgrade to PHP version 5.4.38, or 5.5.22, or 5.6.6, or later.</p>
<p><b>Affected Software/OS</b>  PHP versions before 5.4.38, 5.5.x before 5.5.22, and 5.6.x before 5.6.6 on Linux</p>
<p><b>Vulnerability Insight</b>  The flaw is due to the 'sapi_header_op' function in 'main/SAPI.c' script supports deprecated line folding without considering browser compatibility.</p>
<p><b>Vulnerability Detection Method</b>  Checks if a vulnerable version is present on the target host.  Details: PHP Cross-Site Scripting Vulnerability - Aug16 (Linux)  OID:1.3.6.1.4.1.25623.1.0.809137  Version used: \$Revision: 14181 \$</p>
<p><b>Product Detection Result</b>  Product: cpe:/a:php:php:5.2.4  Method: PHP Version Detection (Remote)  OID: 1.3.6.1.4.1.25623.1.0.800109)</p>

Medium (CVSS: 6.4) NVT: PHP Denial of Service Vulnerability - 02 - Aug16 (Linux)
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> This host is installed with PHP and is prone to denial of service vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.5.31
<b>Impact</b> Successfully exploiting this issue allow attackers to obtain sensitive information from process memory or cause a denial of service (out-of-bounds read and buffer overflow) via a long string.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to PHP version 5.5.31, or 5.6.17, or 7.0.2, or later.
<b>Affected Software/OS</b> PHP versions before 5.5.31, 5.6.x before 5.6.17, and 7.x before 7.0.2 on Linux.
<b>Vulnerability Insight</b> The flaw is due to the 'sapi/fpm/fpm/fpm_log.c' script misinterprets the semantics of the snprintf return value.
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: PHP Denial of Service Vulnerability - 02 - Aug16 (Linux) OID:1.3.6.1.4.1.25623.1.0.809139 Version used: \$Revision: 12051 \$
<b>Product Detection Result</b> Product: cpe:/a:php:php:5.2.4 Method: PHP Version Detection (Remote) OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>References</b> CVE: CVE-2016-5114 BID:81808 Other: URL:http://www.php.net/ChangeLog-5.php

Medium (CVSS: 5.0) NVT: PHP Denial Of Service Vulnerability - April09
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> The host is installed with PHP and is prone to Denial of Service vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.2.9
<b>Impact</b> Successful exploitation could result in denial of service condition.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to version 5.2.9 or later.
<b>Affected Software/OS</b> PHP version prior to 5.2.9
<b>Vulnerability Insight</b> Improper handling of .zip file while doing extraction via php_zip_make_relative_path function in php_zip.c file.
<b>Vulnerability Detection Method</b> Details: PHP Denial Of Service Vulnerability - April09 OID:1.3.6.1.4.1.25623.1.0.800393 Version used: \$Revision: 14031 \$
<b>Product Detection Result</b> Product: cpe:/a:php:php:5.2.4 Method: PHP Version Detection (Remote) OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>References</b> CVE: CVE-2009-1272 Other: URL:http://www.php.net/releases/5_2_9.php URL:http://www.openwall.com/lists/oss-security/2009/04/01/9

Medium (CVSS: 5.0) NVT: PHP FastCGI Module File Extension Denial Of Service Vulnerabilities
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> PHP is prone to a denial-of-service vulnerability because the application fails to handle certain file requests.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.2.8
<b>Impact</b> Attackers can exploit this issue to crash the affected application, denying service to legitimate users.
<b>Solution</b> <b>Solution type:</b> VendorFix Updates are available. Please see the references for more information.
<b>Affected Software/OS</b> PHP 4.4 prior to 4.4.9 and PHP 5.2 through 5.2.6 are vulnerable.
<b>Vulnerability Detection Method</b> Details: PHP FastCGI Module File Extension Denial Of Service Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.100582 Version used: \$Revision: 10459 \$
<b>Product Detection Result</b> Product: cpe:/a:php:php:5.2.4 Method: PHP Version Detection (Remote) OID: 1.3.6.1.4.1.25623.1.0.800109)

Medium (CVSS: 5.0) NVT: PHP Fileinfo Component Denial of Service Vulnerability (Linux)
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> This host is installed with PHP and is prone to denial of service vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.6.0
<b>Impact</b> Successfully exploiting this issue allow remote attackers to cause a denial of service.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to PHP version 5.6.0
<b>Affected Software/OS</b> PHP versions prior to 5.6.0 on Linux
<b>Vulnerability Insight</b> The flaw is due an improper validation of input to zero root_storage value in a CDF file.
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: PHP Fileinfo Component Denial of Service Vulnerability (Linux) OID:1.3.6.1.4.1.25623.1.0.808669 Version used: \$Revision: 11961 \$
<b>Product Detection Result</b> Product: cpe:/a:php:php:5.2.4 Method: PHP Version Detection (Remote) OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>References</b> CVE: CVE-2014-0236 BID:90957 Other: URL:http://www.php.net/ChangeLog-5.php

Medium (CVSS: 5.1) NVT: PHP Man-in-the-Middle Attack Vulnerability - Jul16 (Linux)
<b>Product detection result</b> cpe:/a:php:php:5.2.4 Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> This host is installed with PHP and is prone to Man-in-the-middle attack vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.6.24/7.0.9
<b>Impact</b> Successfully exploiting this issue may allow remote, unauthenticated to conduct MITM attacks on internal server subrequests or direct the server to initiate connections to arbitrary hosts or to cause a denial of service.
<b>Solution</b> <b>Solution type:</b> VendorFix Update to PHP version 5.6.24 or 7.0.19.
<b>Affected Software/OS</b> PHP versions 5.x through 5.6.23 and 7.0.x through 7.0.8 on Linux
<b>Vulnerability Insight</b> The following flaws exist: - The web servers running in a CGI or CGI-like context may assign client request proxy header values to internal HTTP_PROXY environment variables. - 'HTTP_PROXY' is improperly trusted by some PHP libraries and applications - An unspecified flaw in the gdImageCropThreshold function in 'gd_crop.c' in the GD Graphics Library.
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: PHP Man-in-the-Middle Attack Vulnerability - Jul16 (Linux) OID:1.3.6.1.4.1.25623.1.0.808628 Version used: \$Revision: 11969 \$
<b>Product Detection Result</b> Product: cpe:/a:php:php:5.2.4 Method: PHP Version Detection (Remote) OID: 1.3.6.1.4.1.25623.1.0.800109)

Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)
<b>Summary</b> This host is running PHP and is prone to multiple security bypass vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 5.2.4 Fixed version: 5.3.4
<b>Impact</b> Successful exploitation could allow remote attackers to trigger an incomplete output array, and possibly bypass spam detection or have unspecified other impact.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to PHP 5.3.4 or later
<b>Affected Software/OS</b> PHP version prior to 5.3.4
<b>Vulnerability Insight</b> The flaws are caused to: - An error in handling pathname which accepts the '?' character in a pathname. - An error in 'iconv_mime_decode_headers()' function in the 'Iconv' extension. - 'SplFileInfo::getType' function in the Standard PHP Library (SPL) extension, does not properly detect symbolic links in windows. - Integer overflow in the 'mt_rand' function. - Race condition in the 'PCNTL extension', when a user-defined signal handler exists.

Medium (CVSS: 5.0)

NVT: PHP Versions Prior to 5.3.3/5.2.14 Multiple Vulnerabilities

**Product detection result**

cpe:/a:php:php:5.2.4

Detected by PHP Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.0.800109)

**Summary**

PHP is prone to multiple security vulnerabilities.

**Vulnerability Detection Result**

Installed version: 5.2.4

Fixed version: 5.2.14

**Impact**

An attacker can exploit these issues to execute arbitrary code, crash the affected application, gain access to sensitive information and bypass security restrictions. Other attacks are also possible.

**Solution****Solution type:** VendorFix

Updates are available. Please see the references for more information.

**Affected Software/OS**

PHP 5.3 (Prior to 5.3.3) PHP 5.2 (Prior to 5.2.14)

**Vulnerability Detection Method**

Details: PHP Versions Prior to 5.3.3/5.2.14 Multiple Vulnerabilities

<b>Medium (CVSS: 4.3)</b> <b>NVT: phpMyAdmin 'error.php' Cross Site Scripting Vulnerability</b>
<b>Product detection result</b> cpe:/a:phpmyadmin:phpmyadmin:3.1.1 Detected by phpMyAdmin Detection (OID: 1.3.6.1.4.1.25623.1.0.900129)
<b>Summary</b> The host is running phpMyAdmin and is prone to Cross-Site Scripting Vulnerability.
<b>Vulnerability Detection Result</b> Vulnerability was detected according to the Vulnerability Detection Method.
<b>Impact</b> Successful exploitation will allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.
<b>Solution</b> <b>Solution type:</b> WillNotFix No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.
<b>Affected Software/OS</b> phpMyAdmin version 3.3.8.1 and prior.
<b>Vulnerability Insight</b> The flaw is caused by input validation errors in the 'error.php' script when processing crafted BBcode tags containing '@' characters, which could allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.

Medium (CVSS: 4.3)

NVT: phpMyAdmin &lt;= 4.8.2 XSS Vulnerability - PMASA-2018-5 (Linux)

**Product detection result**

cpe:/a:phpmyadmin:phpmyadmin:3.1.1

Detected by phpMyAdmin Detection (OID: 1.3.6.1.4.1.25623.1.0.900129)

**Summary**

phpMyAdmin is prone to an authenticated Cross-Site Scripting (XSS) Vulnerability.

**Vulnerability Detection Result**

Installed version: 3.1.1

Fixed version: 4.8.3

**Solution****Solution type:** VendorFix

Update to version 4.8.3.

**Affected Software/OS**

phpMyAdmin through version 4.8.2.

**Vulnerability Insight**

An authenticated attacker could trick a user into importing a specially crafted file, resulting in the attacker gaining control over the user's account.

**Vulnerability Detection Method**

Checks if a vulnerable version is present on the target host.

Details: phpMyAdmin &lt;= 4.8.2 XSS Vulnerability - PMASA-2018-5 (Linux)

Medium (CVSS: 4.3)

NVT: phpMyAdmin Cross-Site Scripting Vulnerability (PMASA-2018-3)-Linux

**Product detection result**

cpe:/a:phpmyadmin:phpmyadmin:3.1.1

Detected by phpMyAdmin Detection (OID: 1.3.6.1.4.1.25623.1.0.900129)

**Summary**

This host is installed with phpMyAdmin and is prone to cross site scripting vulnerability.

**Vulnerability Detection Result**

Installed version: 3.1.1

Fixed version: 4.8.2

Installation

path / port: /phpMyAdmin

**Impact**

Successful exploitation will allow an attacker to inject arbitrary web script or HTML via crafted database name.

**Solution****Solution type:** VendorFix

Upgrade to version 4.8.2 or newer. For updates refer to Reference links.

**Affected Software/OS**

phpMyAdmin versions prior to 4.8.2 on Linux

**Vulnerability Insight**

The flaw exists due to insufficient validation of input passed to 'js/designer/move.js' script in phpMyAdmin.

**Vulnerability Detection Method**

Checks if a vulnerable version is present on the target host.

<b>References</b> CVE: CVE-2018-20719 Other: URL: <a href="https://blog.ripstech.com/2018/scan-verify-patch-security-issues-in-minute">https://blog.ripstech.com/2018/scan-verify-patch-security-issues-in-minute</a> ↪s/

Medium (CVSS: 5.0) NVT: Tiki Wiki CMS Groupware Input Sanitation Weakness Vulnerability
<b>Product detection result</b> cpe:/a:tiki:tikiwiki_cms/groupware:1.9.5 Detected by Tiki Wiki CMS Groupware Version Detection (OID: 1.3.6.1.4.1.25623.1.↪0.901001)
<b>Summary</b> The host is installed with Tiki Wiki CMS Groupware and is prone to input sanitation weakness vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 1.9.5 Fixed version: 2.2
<b>Impact</b> Successful exploitation could allow arbitrary code execution in the context of an affected site.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to version 2.2 or later.
<b>Affected Software/OS</b> Tiki Wiki CMS Groupware version prior to 2.2 on all running platform
... continues on next page ...

...continued from previous page ...
<b>Vulnerability Insight</b> The vulnerability is due to input validation error in tiki-error.php which fails to sanitise before being returned to the user.
<b>Vulnerability Detection Method</b> Details: Tiki Wiki CMS Groupware Input Sanitation Weakness Vulnerability OID:1.3.6.1.4.1.25623.1.0.800315 Version used: \$Revision: 14010 \$
<b>Product Detection Result</b> Product: cpe:/a:tiki:tikiwiki_cms/groupware:1.9.5 Method: Tiki Wiki CMS Groupware Version Detection OID: 1.3.6.1.4.1.25623.1.0.901001)

Medium (CVSS: 4.3) NVT: TWiki 'organization' Cross-Site Scripting Vulnerability
<b>Product detection result</b> cpe:/a:twiki:twiki:01.Feb.2003 Detected by TWiki Version Detection (OID: 1.3.6.1.4.1.25623.1.0.800399)
<b>Summary</b> The host is running TWiki and is prone to cross site scripting vulnerability.
<b>Vulnerability Detection Result</b> Vulnerable url: http://172.17.0.3/twiki/bin/view/Main/CccCcc
<b>Impact</b> Successful exploitation will allow remote attackers to insert arbitrary HTML and script code, which will be executed in a user's browser session in the context of an affected site.
<b>Solution</b> <b>Solution type:</b> WillNotFix No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.
... continues on next page ...

...continued from previous page ...
<b>Affected Software/OS</b> TWiki version 5.1.1 and prior
<b>Vulnerability Insight</b> The flaw is due to an improper validation of user-supplied input to the 'organization' field when registering or editing a user, which allows attackers to execute arbitrary HTML and script code in a user's browser session in the context of an affected site.
<b>Vulnerability Detection Method</b> Details: TWiki 'organization' Cross-Site Scripting Vulnerability OID:1.3.6.1.4.1.25623.1.0.802391 Version used: \$Revision: 13659 \$
<b>Product Detection Result</b> Product: cpe:/a:twiki:twiki:01.Feb.2003 Method: TWiki Version Detection OID: 1.3.6.1.4.1.25623.1.0.800399)

### Medium 3306/tcp

Medium (CVSS: 6.0) NVT: MySQL Authenticated Access Restrictions Bypass Vulnerability (Linux)
<b>Product detection result</b> cpe:/a:mysql:mysql:5.0.51a Detected by MySQL/MariaDB Detection (OID: 1.3.6.1.4.1.25623.1.0.100152)
<b>Summary</b> The host is running MySQL and is prone to Access Restrictions Bypass Vulnerability.
... continues on next page ...

...continued from previous page ...
<b>Vulnerability Detection Result</b> Installed version: 5.0.51a Fixed version: 5.0.88/5.1.41
<b>Impact</b> Successful exploitation could allow users to bypass intended access restrictions by calling CREATE TABLE with DATA DIRECTORY or INDEX DIRECTORY argument referring to a sub-directory.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to MySQL version 5.0.88 or 5.1.41 or 6.0.9-alpha.
<b>Affected Software/OS</b> MySQL 5.0.x before 5.0.88, 5.1.x before 5.1.41, 6.0 before 6.0.9-alpha.
<b>Vulnerability Insight</b> The flaw is due to an error in 'sql/sql_table.cc', when the data home directory contains a symlink to a different filesystem.
<b>Vulnerability Detection Method</b> Details: MySQL Authenticated Access Restrictions Bypass Vulnerability (Linux) OID:1.3.6.1.4.1.25623.1.0.801065 Version used: \$Revision: 14031 \$
<b>Product Detection Result</b> Product: cpe:/a:mysql:mysql:5.0.51a Method: MySQL/MariaDB Detection OID: 1.3.6.1.4.1.25623.1.0.100152)

Medium (CVSS: 6.8) NVT: MySQL Denial Of Service and Spoofing Vulnerabilities
<b>Product detection result</b> cpe:/a:mysql:mysql:5.0.51a Detected by MySQL/MariaDB Detection (OID: 1.3.6.1.4.1.25623.1.0.100152)
... continues on next page ...

...continued from previous page ...
<b>Summary</b> The host is running MySQL and is prone to Denial Of Service and Spoofing Vulnerabilities
<b>Vulnerability Detection Result</b> Installed version: 5.0.51a Fixed version: 5.0.88 or 5.1.41
<b>Impact</b> Successful exploitation could allow users to cause a Denial of Service and man-in-the-middle attackers to spoof arbitrary SSL-based MySQL servers via a crafted certificate.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to MySQL version 5.0.88 or 5.1.41.
<b>Affected Software/OS</b> MySQL 5.0.x before 5.0.88 and 5.1.x before 5.1.41 on all running platform.
<b>Vulnerability Insight</b> The flaws are due to: - mysqld does not properly handle errors during execution of certain SELECT statements with subqueries, and does not preserve certain null_value flags during execution of statements that use the 'GeomFromWKB()' function. - An error in 'vio_verify_callback()' function in 'vio_sslfactories.c', when OpenSSL is used, accepts a value of zero for the depth of X.509 certificates.
<b>Vulnerability Detection Method</b> Details: MySQL Denial Of Service and Spoofing Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.801064 Version used: \$Revision: 14031 \$
<b>Product Detection Result</b> Product: cpe:/a:mysql:mysql:5.0.51a Method: MySQL/MariaDB Detection OID: 1.3.6.1.4.1.25623.1.0.100152)

Medium (CVSS: 5.0) NVT: MySQL Multiple Denial of Service Vulnerabilities
<b>Product detection result</b> cpe:/a:mysql:mysql:5.0.51a Detected by MySQL/MariaDB Detection (OID: 1.3.6.1.4.1.25623.1.0.100152)
<b>Summary</b> The host is running MySQL and is prone to multiple denial of service vulnerabilities.
<b>Vulnerability Detection Result</b> Vulnerability was detected according to the Vulnerability Detection Method.
<b>Impact</b> Successful exploitation could allow an attacker to cause a denial of service and to execute arbitrary code.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to MySQL version 5.0.92, or 5.1.51 or 5.5.6
<b>Affected Software/OS</b> MySQL 5.0 before 5.0.92, 5.1 before 5.1.51, and 5.5 before 5.5.6
<b>Vulnerability Insight</b> The flaws are due to: <ul style="list-style-type: none"> <li>- An error in propagating the type errors, which allows remote attackers to cause a denial of service via crafted arguments to extreme-value functions such as 'LEAST' or 'GREATEST'.</li> <li>- An unspecified error in vectors related to materializing a derived table that required a temporary table for grouping and user variable assignments.</li> <li>- An error in handling prepared statements that uses GROUP_CONCAT with the WITH ROLLUP modifier.</li> <li>- An error in handling a query that uses the GREATEST or LEAST function with a mixed list of numeric and LONGBLOB arguments.</li> </ul>
<b>Vulnerability Detection Method</b> Details: MySQL Multiple Denial of Service Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.801571 Version used: \$Revision: 12018 \$
<b>Product Detection Result</b> Product: cpe:/a:mysql:mysql:5.0.51a Method: MySQL/MariaDB Detection OID: 1.3.6.1.4.1.25623.1.0.100152)

<b>Solution type:</b> VendorFix Upgrade to MySQL version 5.1.49 or 5.0.92
<b>Affected Software/OS</b> MySQL version 5.1 before 5.1.49 and 5.0 before 5.0.92 on all running platform.
<b>Vulnerability Insight</b> The flaws are due to: - An error in handling of a join query that uses a table with a unique SET column. - An error in handling of 'EXPLAIN' with crafted 'SELECT ... UNION ... ORDER BY (SELECT ... WHERE ...)' statements.
<b>Vulnerability Detection Method</b> Details: MySQL Mysqld Multiple Denial Of Service Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.801567 Version used: \$Revision: 11997 \$

Medium (CVSS: 5.0)

NVT: Oracle MySQL Denial Of Service Vulnerability Feb17 (Linux)

**Product detection result**

cpe:/a:mysql:mysql:5.0.51a

Detected by MySQL/MariaDB Detection (OID: 1.3.6.1.4.1.25623.1.0.100152)

**Summary**

This host is running Oracle MySQL and is prone to denial-of-service vulnerability.

**Vulnerability Detection Result**

Installed version: 5.0.51a

Fixed version: 5.6.21

Installation

path / port: 3306/tcp

**Impact**

Successful exploitation of this vulnerability will allow attackers to cause crash of applications using that MySQL client.

**Solution****Solution type:** VendorFix

Upgrade to Oracle MySQL version 5.6.21 or 5.7.5 or later.

**Affected Software/OS**

Oracle MySQL version before 5.6.21 and 5.7.x before 5.7.5 on Linux

**Vulnerability Insight**

Multiple errors exists as,

- In sql-common/client.c script 'mysql\_prune\_stmt\_list' function, the for loop adds elements to pruned\_list without removing it from the existing list.
- If application gets disconnected just before it tries to prepare a new statement, 'mysql\_prune\_stmt\_list' tries to detach all previously prepared statements.

**Vulnerability Detection Method**

Checks if a vulnerable version is present on the target host.

Details: Oracle MySQL Denial Of Service Vulnerability Feb17 (Linux)

OID:1.3.6.1.4.1.25623.1.0.810604

Version used: \$Revision: 12983 \$

Medium (CVSS: 4.0)

NVT: Oracle MySQL Prior to 5.1.49 Multiple Denial Of Service Vulnerabilities

**Product detection result**

cpe:/a:mysql:mysql:5.0.51a

Detected by MySQL/MariaDB Detection (OID: 1.3.6.1.4.1.25623.1.0.100152)

**Summary**

MySQL is prone to a denial-of-service vulnerability.

An attacker can exploit this issue to crash the database, denying access to legitimate users.

This issue affects versions prior to MySQL 5.1.49.

**Vulnerability Detection Result**

Vulnerability was detected according to the Vulnerability Detection Method.

**Solution****Solution type:** VendorFix

Updates are available. Please see the references for more information.

**Vulnerability Detection Method**

<b>Product detection result</b> cpe:/a:openbsd:openssh:4.7p1 Detected by SSH Server type and version (OID: 1.3.6.1.4.1.25623.1.0.10267)
<b>Summary</b> ... continues on next page ...

...continued from previous page ...
This host is installed with openssh and is prone to user enumeration vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 4.7p1 Fixed version: 7.8 Installation path / port: 22/tcp
<b>Impact</b> Successfully exploitation will allow remote attacker to test whether a certain user exists or not (username enumeration) on a target OpenSSH server.
<b>Solution</b> <b>Solution type:</b> VendorFix Update to version 7.8 or later.
<b>Affected Software/OS</b> OpenSSH versions 7.7 and prior on Linux
<b>Vulnerability Insight</b> The flaw is due to not delaying bailout for an invalid authenticating user until after the packet containing the request has been fully parsed, related to auth2-gss.c, auth2-hostbased.c, and auth2-pubkey.c
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: OpenSSH User Enumeration Vulnerability-Aug18 (Linux) OID:1.3.6.1.4.1.25623.1.0.813864 Version used: \$Revision: 12956 \$
<b>Product Detection Result</b> Product: cpe:/a:openbsd:openssh:4.7p1 Method: SSH Server type and version OID: 1.3.6.1.4.1.25623.1.0.10267)
<b>References</b> CVE: CVE-2018-15473 Other: URL:http://www.openssh.com URL:https://0day.city/cve-2018-15473.html URL:https://github.com/openbsd/src/commit/779974d35b4859c07bc3cb8a12c74b43b0a↵7d1e0
Medium (CVSS: 4.3) NVT: SSH Weak Encryption Algorithms Supported
... continues on next page ...

...continued from previous page ...	
<b>Summary</b>	The remote SSH server is configured to allow weak encryption algorithms.
<b>Vulnerability Detection Result</b>	<p>The following weak client-to-server encryption algorithms are supported by the remote service:</p> <pre>3des-cbc aes128-cbc aes192-cbc aes256-cbc arcfour arcfour128 arcfour256 blowfish-cbc cast128-cbc rijndael-cbc@lysator.liu.se</pre> <p>The following weak server-to-client encryption algorithms are supported by the remote service:</p> <pre>3des-cbc aes128-cbc aes192-cbc aes256-cbc arcfour arcfour128 arcfour256 blowfish-cbc cast128-cbc rijndael-cbc@lysator.liu.se</pre>
<b>Solution</b>	<p><b>Solution type:</b> Mitigation</p> <p>Disable the weak encryption algorithms.</p>
<b>Vulnerability Insight</b>	<p>The ‘arcfour’ cipher is the Arcfour stream cipher with 128-bit keys. The Arcfour cipher is believed to be compatible with the RC4 cipher [SCHNEIER]. Arcfour (and RC4) has problems with weak keys, and should not be used anymore.</p> <p>The ‘none’ algorithm specifies that no encryption is to be done. Note that this method provides no confidentiality protection, and it is NOT RECOMMENDED to use it.</p> <p>A vulnerability exists in SSH messages that employ CBC mode that may allow an attacker to recover plaintext from a block of ciphertext.</p>
<b>Vulnerability Detection Method</b>	<p>Check if remote ssh service supports Arcfour, none or CBC ciphers.</p> <p>Details: SSH Weak Encryption Algorithms Supported</p> <p>OID:1.3.6.1.4.1.25623.1.0.105611</p> <p>Version used: \$Revision: 13581 \$</p>

Medium (CVSS: 6.5)

NVT: PostgreSQL 'bitsubstr' Buffer Overflow Vulnerability

**Product detection result**

cpe:/a:postgresql:postgresql:8.3.1

Detected by PostgreSQL Detection (OID: 1.3.6.1.4.1.25623.1.0.100151)

**Summary**

PostgreSQL is prone to a buffer-overflow vulnerability because the application fails to perform adequate boundary checks on user-supplied data.

**Vulnerability Detection Result**

Installed version: 8.3.1

Fixed version: See references

**Impact**

Attackers can exploit this issue to execute arbitrary code with elevated privileges or crash the affected application.

**Solution****Solution type:** VendorFix

Updates are available. Please see the references for more information.

**Affected Software/OS**

PostgreSQL version 8.0.x, 8.1.x, 8.3.x is vulnerable. Other versions may also be affected.

**Vulnerability Detection Method**

Details: PostgreSQL 'bitsubstr' Buffer Overflow Vulnerability

OID: 1.3.6.1.4.1.25623.1.0.100470

Version used: \$Revision: 13960 \$

**Product Detection Result**

Product: cpe:/a:postgresql:postgresql:8.3.1

Method: PostgreSQL Detection

OID: 1.3.6.1.4.1.25623.1.0.100151)

Medium (CVSS: 6.5)

NVT: PostgreSQL 'intarray' Module 'gettoken()' Buffer Overflow Vulnerability

**Product detection result**

cpe:/a:postgresql:postgresql:8.3.1

Detected by PostgreSQL Detection (OID: 1.3.6.1.4.1.25623.1.0.100151)

**Summary**

PostgreSQL is prone to a buffer-overflow vulnerability because the application fails to perform adequate boundary checks on user-supplied data. The issue affects the 'intarray' module.

**Vulnerability Detection Result**

Installed version: 8.3.1

Fixed version: See references

**Impact**

An authenticated attacker can leverage this issue to execute arbitrary code within the context of the vulnerable application. Failed exploit attempts will result in a denial-of-service condition.

**Solution****Solution type:** VendorFix

Updates are available. Please see the references for more information.

**Affected Software/OS**

The issue affect versions prior to 8.2.20, 8.3.14, 8.4.7, and 9.0.3.

**Vulnerability Detection Method**

Details: PostgreSQL 'intarray' Module 'gettoken()' Buffer Overflow Vulnerability

OID:1.3.6.1.4.1.25623.1.0.103054

Version used: \$Revision: 11997 \$

**Solution****Solution type:** Mitigation

Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.

**Vulnerability Insight**

The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use:

- Secure Hash Algorithm 1 (SHA-1)
- Message Digest 5 (MD5)
- Message Digest 4 (MD4)
- Message Digest 2 (MD2)

Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates.

NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive:

Fingerprint1

or

fingerprint1,Fingerprint2

**Vulnerability Detection Method**

Check which hashing algorithm was used to sign the remote SSL/TLS certificate.

Details: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm

Medium (CVSS: 6.8) NVT: SSL/TLS: OpenSSL CCS Man in the Middle Security Bypass Vulnerability
<b>Summary</b> OpenSSL is prone to security-bypass vulnerability.
<b>Vulnerability Detection Result</b> Vulnerability was detected according to the Vulnerability Detection Method.
<b>Impact</b> Successfully exploiting this issue may allow attackers to obtain sensitive information by conducting a man-in-the-middle attack. This may lead to other attacks.
<b>Solution</b> <b>Solution type:</b> VendorFix Updates are available. Please see the references for more information.
<b>Affected Software/OS</b> OpenSSL before 0.9.8za, 1.0.0 before 1.0.0m and 1.0.1 before 1.0.1h.
... continues on next page ...

...continued from previous page...

**Vulnerability Insight**

OpenSSL does not properly restrict processing of ChangeCipherSpec messages, which allows man-in-the-middle attackers to trigger use of a zero-length master key in certain OpenSSL-to-OpenSSL communications, and consequently hijack sessions or obtain sensitive information, via a crafted TLS handshake, aka the 'CCS Injection' vulnerability.

**Vulnerability Detection Method**

Send two SSL ChangeCipherSpec request and check the response.

Medium (CVSS: 4.3)

NVT: SSL/TLS: Report Weak Cipher Suites

**Summary**

This routine reports all Weak SSL/TLS cipher suites accepted by a service.

NOTE: No severity for SMTP services with 'Opportunistic TLS' and weak cipher suites on port 25/tcp is reported. If too strong cipher suites are configured for this service the alternative would be to fall back to an even more insecure cleartext communication.

**Vulnerability Detection Result**

'Weak' cipher suites accepted by this service via the SSLv3 protocol:

TLS\_RSA\_WITH\_RC4\_128\_SHA

'Weak' cipher suites accepted by this service via the TLSv1.0 protocol:

TLS\_RSA\_WITH\_RC4\_128\_SHA

**Solution**

**Solution type:** Mitigation

The configuration of this services should be changed so that it does not accept the listed weak cipher suites anymore.

Please see the references for more resources supporting you with this task.

**Vulnerability Insight**

These rules are applied for the evaluation of the cryptographic strength:

- RC4 is considered to be weak (CVE-2013-2566, CVE-2015-2808).

- Ciphers using 64 bit or less are considered to be vulnerable to brute force methods and therefore considered as weak (CVE-2015-4000).

... continues on next page ...

...continued from previous page ...
<ul style="list-style-type: none"> <li>- 1024 bit RSA authentication is considered to be insecure and therefore as weak.</li> <li>- Any cipher considered to be secure for only the next 10 years is considered as medium</li> <li>- Any other cipher is considered as strong</li> </ul>

Medium (CVSS: 4.3)

NVT: SSL/TLS: 'DHE\_EXPORT' Man in the Middle Security Bypass Vulnerability (LogJam)

**Summary**

This host is accepting 'DHE\_EXPORT' cipher suites and is prone to man in the middle attack.

**Vulnerability Detection Result**

'DHE\_EXPORT' cipher suites accepted by this service via the SSLv3 protocol:

TLS\_DHE\_RSA\_EXPORT\_WITH\_DES40\_CBC\_SHA

TLS\_DH\_anon\_EXPORT\_WITH\_DES40\_CBC\_SHA

TLS\_DH\_anon\_EXPORT\_WITH\_RC4\_40\_MD5

'DHE\_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol:

TLS\_DHE\_RSA\_EXPORT\_WITH\_DES40\_CBC\_SHA

TLS\_DH\_anon\_EXPORT\_WITH\_DES40\_CBC\_SHA

TLS\_DH\_anon\_EXPORT\_WITH\_RC4\_40\_MD5

**Impact**

Successful exploitation will allow a man-in-the-middle attacker to downgrade the security of a TLS session to 512-bit export-grade cryptography, which is significantly weaker, allowing the attacker to more easily break the encryption and monitor or tamper with the encrypted stream.

**Solution**

**Solution type:** VendorFix

- Remove support for 'DHE\_EXPORT' cipher suites from the service

- If running OpenSSL update to version 1.0.2b or 1.0.1n or later.

**Affected Software/OS**

- Hosts accepting 'DHE\_EXPORT' cipher suites

- OpenSSL version before 1.0.2b and 1.0.1n

**Vulnerability Insight**

<b>Vulnerability Insight</b> The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.	
<b>Vulnerability Detection Method</b> Checks the DHE temporary public key size. Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability. ↪.. OID:1.3.6.1.4.1.25623.1.0.106223

Medium (CVSS: 4.3) NVT: SSL/TLS: RSA Temporary Key Handling 'RSA_EXPORT' Downgrade Issue (FREAK)
<b>Summary</b> This host is accepting 'RSA_EXPORT' cipher suites and is prone to man in the middle attack.
<b>Vulnerability Detection Result</b> 'RSA_EXPORT' cipher suites accepted by this service via the SSLv3 protocol: TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5 TLS_RSA_EXPORT_WITH_RC4_40_MD5 'RSA_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol: TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5 TLS_RSA_EXPORT_WITH_RC4_40_MD5
<b>Impact</b> Successful exploitation will allow remote attacker to downgrade the security of a session to use 'RSA_EXPORT' cipher suites, which are significantly weaker than non-export cipher suites. This may allow a man-in-the-middle attacker to more easily break the encryption and monitor or tamper with the encrypted stream.
<b>Solution</b> <b>Solution type:</b> VendorFix - Remove support for 'RSA_EXPORT' cipher suites from the service. - If running OpenSSL update to version 0.9.8zd or 1.0.0p or 1.0.1k or later.
<b>Affected Software/OS</b> - Hosts accepting 'RSA_EXPORT' cipher suites - OpenSSL version before 0.9.8zd, 1.0.0 before 1.0.0p, and 1.0.1 before 1.0.1k.
<b>Vulnerability Insight</b> Flaw is due to improper handling RSA temporary keys in a non-export RSA key exchange cipher suite.
<b>Vulnerability Detection Method</b> Check previous collected cipher suites saved in the KB.

NVT: Samba 'fd\_open\_atomic infinite loop' Denial-of-Service Vulnerability

**Product detection result**

cpe:/a:samba:samba:3.0.20

Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)

**Summary**

This host is running Samba and is prone to denial-of-service vulnerability.

**Vulnerability Detection Result**

Installed version: 3.0.20

Fixed version: 4.4.10

Installation

path / port: 445/tcp

**Impact**

Successfully exploiting this issue will allow remote attackers to conduct a denial-of-service condition(infinite loop with high CPU usage and memory consumption).

**Solution****Solution type:** VendorFix

Upgrade to Samba 4.4.10 or 4.5.6 or later.

**Affected Software/OS**

Samba versions before 4.4.10 and 4.5.x before 4.5.6

**Vulnerability Insight**

The flaw exists due to error in smbd which enters infinite loop when trying to open an invalid symlink with O\_CREAT.

... continues on next page ...

...continued from previous page ...

**Vulnerability Detection Method**

Checks if a vulnerable version is present on the target host.

Details: Samba 'fd\_open\_atomic infinite loop' Denial-of-Service Vulnerability

NVT: Samba winbind Daemon Denial of Service Vulnerability

**Product detection result**

cpe:/a:samba:samba:3.0.20

Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)

**Summary**

This host is installed with Samba for Linux and is prone to Winbind daemon Denial of Service Vulnerability.

**Vulnerability Detection Result**

Installed version: 3.0.20

Fixed version: 3.0.32

Installation

path / port: 445/tcp

**Impact**

Successful exploitation will let the attacker crash the application.

**Solution****Solution type:** VendorFix

Upgrade to version 3.0.32 or later.

**Affected Software/OS**

Samba version prior to 3.0.32.

**Vulnerability Insight**

This flaw is due to a race condition in the winbind daemon which allows remote attackers to cause denial of service through unspecified vectors related to an unresponsive child process.

**Vulnerability Detection Method**

Details: Samba winbind Daemon Denial of Service Vulnerability

## Medium 21/tcp

Medium (CVSS: 6.4) NVT: Anonymous FTP Login Reporting
<b>Summary</b> Reports if the remote FTP Server allows anonymous logins.
<b>Vulnerability Detection Result</b> It was possible to login to the remote FTP service with the following anonymous ↪account(s): anonymous:anonymous@example.com ftp:anonymous@example.com
<b>Impact</b> Based on the files accessible via this anonymous FTP login and the permissions of this account an attacker might be able to: - gain access to sensitive files - upload or delete files.
<b>Solution</b> <b>Solution type:</b> Mitigation If you do not want to share files, you should disable anonymous logins.
<b>Vulnerability Insight</b> A host that provides an FTP service may additionally provide Anonymous FTP access as well. Under this arrangement, users do not strictly need an account on the host. Instead the user typically enters 'anonymous' or 'ftp' when prompted for username. Although users are commonly asked to send their email address as their password, little to no verification is actually performed on the supplied data.
<b>Vulnerability Detection Method</b> Details: Anonymous FTP Login Reporting OID:1.3.6.1.4.1.25623.1.0.900600

<b>References</b> Other: URL: <a href="https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-1999-0497">https://web.nvd.nist.gov/view/vuln/detail?vulnId=CVE-1999-0497</a>

Medium (CVSS: 4.8) NVT: FTP Unencrypted Cleartext Login
<b>Summary</b> The remote host is running a FTP service that allows cleartext logins over unencrypted connections.
<b>Vulnerability Detection Result</b> The remote FTP service accepts logins without a previous sent 'AUTH TLS' command ↵. Response(s): Anonymous sessions: 331 Please specify the password. Non-anonymous sessions: 331 Please specify the password.
<b>Impact</b> An attacker can uncover login names and passwords by sniffing traffic to the FTP service.
<b>Solution</b> <b>Solution type:</b> Mitigation Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.
<b>Vulnerability Detection Method</b> Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command. Details: FTP Unencrypted Cleartext Login OID: 1.3.6.1.4.1.25623.1.0.108528 Version used: \$Revision: 13611 \$

Medium (CVSS: 5.1) NVT: vsftpd '__tzfile_read()' Function Heap Based Buffer Overflow Vulnerability
<b>Product detection result</b> cpe:/a:beasts:vsftpd:2.3.4 Detected by vsFTPD FTP Server Detection (OID: 1.3.6.1.4.1.25623.1.0.111050)
<b>Summary</b> ... continues on next page ...

...continued from previous page ...
vsftpd is prone to a buffer-overflow vulnerability because it fails to perform adequate boundary checks on user-supplied data.
<b>Vulnerability Detection Result</b> Installed version: 2.3.4 Fixed version: 2.3.5
<b>Impact</b> Attackers may leverage this issue to execute arbitrary code in the context of the application. Failed attacks will cause denial-of-service conditions.
<b>Solution</b> <b>Solution type:</b> VendorFix A fixed version 2.3.5 is available. Please see the references for more information.
<b>Affected Software/OS</b> vsftpd 2.3.4 is affected. Other versions may also be vulnerable.
<b>Vulnerability Detection Method</b> Details: vsftpd '_tzfile_read()' Function Heap Based Buffer Overflow Vulnerability OID:1.3.6.1.4.1.25623.1.0.103362 Version used: \$Revision: 12018 \$
<b>Product Detection Result</b> Product: cpe:/a:beasts:vsftpd:2.3.4 Method: vsFTPd FTP Server Detection OID: 1.3.6.1.4.1.25623.1.0.111050)
<b>References</b> BID:51013 Other: URL:http://www.securityfocus.com/bid/51013 URL:http://dividead.wordpress.com/tag/heap-overflow/ URL:https://security.appspot.com/vsftpd/Changelog.txt URL:https://security.appspot.com/vsftpd.html
Medium (CVSS: 5.0) NVT: vsftpd < 3.0.3 Security Bypass Vulnerability
<b>Product detection result</b> cpe:/a:beasts:vsftpd:2.3.4 Detected by vsFTPd FTP Server Detection (OID: 1.3.6.1.4.1.25623.1.0.111050)
<b>Summary</b> ... continues on next page ...

...continued from previous page ...
vsftpd is prone to a security-bypass vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 2.3.4 Fixed version: 3.0.3
<b>Impact</b> An attacker can exploit this issue to bypass certain security restrictions and perform unauthorized actions. This may aid in further attacks.
<b>Solution</b> <b>Solution type:</b> VendorFix A fixed version 3.0.3 is available. Please see the references for more information.
<b>Affected Software/OS</b> vsftpd versions 3.0.2 and below are vulnerable.
<b>Vulnerability Detection Method</b> Details: vsftpd < 3.0.3 Security Bypass Vulnerability OID:1.3.6.1.4.1.25623.1.0.108045 Version used: \$Revision: 5026 \$
<b>Product Detection Result</b> Product: cpe:/a:beasts:vsftpd:2.3.4 Method: vsFTPD FTP Server Detection OID: 1.3.6.1.4.1.25623.1.0.111050)

### Low general/tcp

Low (CVSS: 2.6) NVT: TCP timestamps
<b>Summary</b> The remote host implements TCP timestamps and therefore allows to compute the uptime. ... continues on next page ...

...continued from previous page ...
<b>Vulnerability Detection Result</b> It was detected that the host implements RFC1323. The following timestamps were retrieved with a delay of 1 seconds in-between: Packet 1: 246103389 Packet 2: 246104428
<b>Impact</b> A side effect of this feature is that the uptime of the remote host can sometimes be computed.
<b>Solution</b> <b>Solution type:</b> Mitigation To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime. To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled' Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled. The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment. See the references for more information.
<b>Affected Software/OS</b> TCP/IPv4 implementations that implement RFC1323.
<b>Vulnerability Insight</b> The remote host implements TCP timestamps, as defined by RFC1323.
<b>Vulnerability Detection Method</b> Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported. Details: TCP timestamps OID:1.3.6.1.4.1.25623.1.0.80091 Version used: \$Revision: 14310 \$
<b>References</b> <b>Other:</b> URL: <a href="http://www.ietf.org/rfc/rfc1323.txt">http://www.ietf.org/rfc/rfc1323.txt</a> URL: <a href="http://www.microsoft.com/en-us/download/details.aspx?id=9152">http://www.microsoft.com/en-us/download/details.aspx?id=9152</a>

## Low 6667/tcp

Low (CVSS: 2.1)
NVT: UnrealIRCd Local Privilege Escalation Vulnerability
... continues on next page ...

...continued from previous page ...
<b>Product detection result</b> cpe:/a:unrealircd:unrealircd:3.2.8.1 Detected by UnrealIRCd Detection (OID: 1.3.6.1.4.1.25623.1.0.809884)
<b>Summary</b> This host is installed with UnrealIRCd and is prone to local privilege escalation vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 3.2.8.1 Fixed version: Please see the solution tag for an available Workaround
<b>Impact</b> Successful exploitation of this vulnerability will allow attackers to gain elevated privileges.
<b>Solution</b> <b>Solution type:</b> Workaround Please see the referenced bugreport for a workaround how to mitigate this issue within the used start scripts.
<b>Affected Software/OS</b> UnrealIRCd versions 4.0.13 and prior.
<b>Vulnerability Insight</b> The flaw exists due to error in handling of PID file. A PID file after dropping privileges to a non-root account, which might allow local users to kill arbitrary processes by leveraging access to this non-root account for PID file modification before a root script executes a 'kill cat /pathname' command.
<b>Vulnerability Detection Method</b> Checks if a vulnerable version is present on the target host. Details: UnrealIRCd Local Privilege Escalation Vulnerability OID:1.3.6.1.4.1.25623.1.0.811317 Version used: \$Revision: 11874 \$
<b>Product Detection Result</b> Product: cpe:/a:unrealircd:unrealircd:3.2.8.1 Method: UnrealIRCd Detection OID: 1.3.6.1.4.1.25623.1.0.809884)

Low (CVSS: 2.1)

NVT: ProFTPD 'AllowChrootSymlinks' Local Security Bypass Vulnerability

**Product detection result**

cpe:/a:proftpd:proftpd:1.3.1

Detected by ProFTPD Server Version Detection (Remote) (OID: 1.3.6.1.4.1.25623.1.↪0.900815)

**Summary**

This host is running ProFTPD server and is prone to local security bypass vulnerability.

**Vulnerability Detection Result**

Installed version: 1.3.1

Fixed version: 1.3.5e/1.3.6rc5

**Impact**

Successful exploitation will allows attackers to bypass certain security restrictions and perform unauthorized actions.

**Solution****Solution type:** VendorFix

Upgrade ProFTPD 1.3.5e, 1.3.6rc5 or later.

**Affected Software/OS**

ProFTPD versions prior to 1.3.5e and 1.3.6 prior to 1.3.6rc5 are vulnerable.

**Vulnerability Insight**

The ProFTPD controls whether the home directory of a user could contain a symbolic link through the AllowChrootSymlinks configuration option, but checks only the last path component when enforcing AllowChrootSymlinks.

**Vulnerability Detection Method**

Checks if a vulnerable version is present on the target host.

Details: ProFTPD 'AllowChrootSymlinks' Local Security Bypass Vulnerability

## Low 80/tcp

Low (CVSS: 2.6) NVT: Apache 'mod_proxy_ftp' Module Denial Of Service Vulnerability (Linux)
<b>Summary</b> The host is running Apache and is prone to Denial of Service vulnerability.
<b>Vulnerability Detection Result</b> Vulnerability was detected according to the Vulnerability Detection Method.
<b>Impact</b> Successful exploitation could allow remote attackers to cause a Denial of Service in the context of the affected application.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to Apache HTTP Server version 2.2.15 or later
<b>Affected Software/OS</b> Apache HTTP Server version 2.0.x to 2.0.63 and and 2.2.x to 2.2.13 on Linux.
<b>Vulnerability Insight</b> The flaw is due to an error in 'ap_proxy_ftp_handler' function in modules/proxy/proxy_ftp.c in the mod_proxy_ftp module while processing responses received from FTP servers. This can be exploited to trigger a NULL-pointer dereference and crash an Apache child process via a malformed EPSV response.
... continues on next page ...

...continued from previous page ...
<b>Vulnerability Detection Method</b> Details: Apache 'mod_proxy_ftp' Module Denial Of Service Vulnerability (Linux) OID:1.3.6.1.4.1.25623.1.0.900841 Version used: \$Revision: 14335 \$

Low (CVSS: 1.2) NVT: Apache HTTP Server 'ap_pregsub()' Function Local Denial of Service Vulnerability
<b>Product detection result</b> cpe:/a:apache:http_server:2.2.8 Detected by Apache Web Server Detection (OID: 1.3.6.1.4.1.25623.1.0.900498)
<b>Summary</b> Apache HTTP Server is prone to a local denial-of-service vulnerability because of a NULL-pointer dereference error or a memory exhaustion.
<b>Vulnerability Detection Result</b> Installed version: 2.2.8 Fixed version: See references
<b>Impact</b> Local attackers can exploit this issue to trigger a NULL-pointer dereference or memory exhaustion, and cause a server crash, denying service to legitimate users. Note: To trigger this issue, 'mod_setenvif' must be enabled and the attacker should be able to place a malicious '.htaccess' file on the affected webserver.
<b>Solution</b> <b>Solution type:</b> VendorFix
<b>Affected Software/OS</b> Apache HTTP Server 2.0.x through 2.0.64 and 2.2.x through 2.2.21 are vulnerable. Other versions may also be affected.
<b>Vulnerability Detection Method</b> ... continues on next page ...

Low (CVSS: 2.6) NVT: OpenSSH CBC Mode Information Disclosure Vulnerability
<b>Product detection result</b> cpe:/a:openbsd:openssh:4.7p1 Detected by SSH Server type and version (OID: 1.3.6.1.4.1.25623.1.0.10267)
<b>Summary</b> The host is installed with OpenSSH and is prone to information disclosure vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 4.7p1 Fixed version: 5.2
<b>Impact</b> Successful exploits will allow attackers to obtain four bytes of plaintext from an encrypted session.
<b>Solution</b> <b>Solution type:</b> VendorFix Upgrade to OpenSSH 5.2 or later.
<b>Affected Software/OS</b> Versions prior to OpenSSH 5.2 are vulnerable. Various versions of SSH Tectia are also affected.
<b>Vulnerability Insight</b> The flaw is due to the improper handling of errors within an SSH session encrypted with a block cipher algorithm in the Cipher-Block Chaining 'CBC' mode.
<b>Vulnerability Detection Method</b> Details: OpenSSH CBC Mode Information Disclosure Vulnerability OID:1.3.6.1.4.1.25623.1.0.100153 Version used: \$Revision: 13562 \$
<b>Product Detection Result</b> Product: cpe:/a:openbsd:openssh:4.7p1 Method: SSH Server type and version OID: 1.3.6.1.4.1.25623.1.0.10267)
<b>References</b> CVE: CVE-2008-5161 BID:32319 Other: URL:http://www.securityfocus.com/bid/32319

Low (CVSS: 3.5) NVT: openssh-server Forced Command Handling Information Disclosure Vulnerability
<b>Product detection result</b> cpe:/a:openbsd:openssh:4.7p1 Detected by SSH Server type and version (OID: 1.3.6.1.4.1.25623.1.0.10267)
<b>Summary</b> The auth_parse_options function in auth-options.c in sshd in OpenSSH before 5.7 provides debug messages containing authorized_keys command options, which allows remote authenticated users to obtain potentially sensitive information by reading these messages, as demonstrated by the shared user account required by Gitolite. NOTE: this can cross privilege boundaries because a user account may intentionally have no shell or filesystem access, and therefore may have no supported way to read an authorized_keys file in its own home directory.
<b>Vulnerability Detection Result</b> Installed version: 4.7p1 Fixed version: 5.7
<b>Solution</b> <b>Solution type:</b> VendorFix Updates are available. Please see the references for more information.
<b>Affected Software/OS</b> OpenSSH before 5.7
<b>Vulnerability Detection Method</b> Details: openssh-server Forced Command Handling Information Disclosure Vulnerability OID:1.3.6.1.4.1.25623.1.0.103503 Version used: \$Revision: 7906 \$
<b>Product Detection Result</b> Product: cpe:/a:openbsd:openssh:4.7p1 Method: SSH Server type and version OID: 1.3.6.1.4.1.25623.1.0.10267)
<b>References</b> CVE: CVE-2012-0814 BID:51702 Other: URL:http://www.securityfocus.com/bid/51702 URL:http://bugs.debian.org/cgi-bin/bugreport.cgi?bug=657445 URL:http://packages.debian.org/squeeze/openssh-server URL:https://downloads.avaya.com/css/P8/documents/100161262

Low (CVSS: 2.6) NVT: SSH Weak MAC Algorithms Supported
<b>Summary</b> The remote SSH server is configured to allow weak MD5 and/or 96-bit MAC algorithms.
<b>Vulnerability Detection Result</b> The following weak client-to-server MAC algorithms are supported by the remote s ↔ervice: hmac-md5 hmac-md5-96 hmac-sha1-96 The following weak server-to-client MAC algorithms are supported by the remote s ↔ervice: hmac-md5 hmac-md5-96 hmac-sha1-96
<b>Solution</b> <b>Solution type:</b> Mitigation Disable the weak MAC algorithms.
<b>Vulnerability Detection Method</b> Details: SSH Weak MAC Algorithms Supported OID:1.3.6.1.4.1.25623.1.0.105610 Version used: \$Revision: 13581 \$

## Low 5432/tcp

Low (CVSS: 3.5) NVT: PostgreSQL Hash Table Integer Overflow Vulnerability
<b>Product detection result</b> cpe:/a:postgresql:postgresql:8.3.1 Detected by PostgreSQL Detection (OID: 1.3.6.1.4.1.25623.1.0.100151)
<b>Summary</b> The host is running PostgreSQL and is prone to integer overflow vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 8.3.1 Fixed version: See references
<b>Impact</b> ... continues on next page ...

...continued from previous page ...
Successful exploitation could allow execution of specially-crafted sql query which once processed would lead to denial of service (postgresql daemon crash).
<b>Solution</b> <b>Solution type:</b> VendorFix Apply the patch linked in the references.
<b>Affected Software/OS</b> PostgreSQL version 8.4.1 and prior and 8.5 through 8.5alpha2
<b>Vulnerability Insight</b> The flaw is due to an integer overflow error in 'src/backend/executor/nodeHash.c', when used to calculate size for the hashtable for joined relations.
<b>Vulnerability Detection Method</b> Details: PostgreSQL Hash Table Integer Overflow Vulnerability OID:1.3.6.1.4.1.25623.1.0.902139 Version used: \$Revision: 13960 \$

Low (CVSS: 3.3) NVT: Samba 'etc/mtab' File Appending Local Denial of Service Vulnerability
<b>Product detection result</b> cpe:/a:samba:samba:3.0.20 Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)
... continues on next page ...

...continued from previous page ...
<b>Summary</b> Samba is prone to a local denial-of-service vulnerability.
<b>Vulnerability Detection Result</b> Installed version: 3.0.20 Fixed version: 3.5.9 Installation path / port: 445/tcp
<b>Impact</b> A local attacker can exploit this issue to cause the computer to stop responding, denying service to legitimate users.
<b>Solution</b> <b>Solution type:</b> VendorFix Updates are available. Please see the references for more information.
<b>Vulnerability Detection Method</b> Details: Samba 'etc/mtab' File Appending Local Denial of Service Vulnerability OID:1.3.6.1.4.1.25623.1.0.103298 Version used: \$Revision: 10398 \$
<b>Product Detection Result</b> Product: cpe:/a:samba:samba:3.0.20 Method: SMB NativeLanMan OID: 1.3.6.1.4.1.25623.1.0.102011)
<b>References</b> CVE: CVE-2011-1678 BID:49939 Other: URL:http://www.securityfocus.com/bid/49939 URL:https://bugzilla.redhat.com/show_bug.cgi?id=CVE-2011-1678 URL:http://us1.samba.org/samba/
Low (CVSS: 3.5) NVT: Samba Symlink Directory Traversal Vulnerability
<b>Product detection result</b> cpe:/a:samba:samba:3.0.20 Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)
... continues on next page ...

...continued from previous page ...
<b>Summary</b> Samba is prone to a directory-traversal vulnerability because the application fails to sufficiently sanitize user-supplied input.
<b>Vulnerability Detection Result</b> Installed version: 3.0.20 Fixed version: 3.3.11/3.4.6/3.5.0rc3 Installation path / port: 445/tcp
<b>Impact</b> Exploits would allow an attacker to access files outside of the Samba user's root directory to obtain sensitive information and perform other attacks.
<b>Solution</b> <b>Solution type:</b> VendorFix The vendor commented on the issue stating that it stems from an insecure default configuration. The Samba team advises administrators to set 'wide links = no' in the '[global]' section of 'smb.conf' and then restart the service to correct misconfigured services. Please see the references for more information.
<b>Affected Software/OS</b> Samba versions before 3.3.11, 3.4.x before 3.4.6, and 3.5.x before 3.5.0rc3.
<b>Vulnerability Insight</b> To exploit this issue, attackers require authenticated access to a writable share. Note that this issue may be exploited through a writable share accessible by guest accounts.
<b>Vulnerability Detection Method</b> Details: Samba Symlink Directory Traversal Vulnerability OID:1.3.6.1.4.1.25623.1.0.100488 Version used: \$Revision: 10398 \$

NVT: OS Detection Consolidation and Reporting

### Summary

This script consolidates the OS information detected by several NVTs and tries to find the best matching OS.

Furthermore it reports all previously collected information leading to this best matching OS. It also reports possible additional information which might help to improve the OS detection.

If any of this information is wrong or could be improved please consider to report these to the referenced community portal.

### Vulnerability Detection Result

Best matching OS:

OS: Ubuntu 8.04

Version: 8.04

CPE: cpe:/o:canonical:ubuntu\_linux:8.04

Found by NVT: 1.3.6.1.4.1.25623.1.0.105586 (SSH OS Identification)

Concluded from SSH banner on port 22/tcp: SSH-2.0-OpenSSH\_4.7p1 Debian-8ubuntu1

Setting key "Host/runs\_unixoide" based on this information

Other OS detections (in order of reliability):

OS: Linux/Unix

CPE: cpe:/o:linux:kernel

Found by NVT: 1.3.6.1.4.1.25623.1.0.105355 (FTP OS Identification)

Concluded from FTP banner on port 21/tcp: 220 (vsFTPD 2.3.4)

OS: Debian GNU/Linux

CPE: cpe:/o:debian:debian\_linux

Found by NVT: 1.3.6.1.4.1.25623.1.0.105355 (FTP OS Identification)

Concluded from FTP banner on port 2121/tcp: 220 ProFTPD 1.3.1 Server (Debian) [ : ↵:ffff:172.17.0.3]

OS: Debian GNU/Linux

CPE: cpe:/o:debian:debian\_linux

Found by NVT: 1.3.6.1.4.1.25623.1.0.102011 (SMB NativeLanMan)

Concluded from SMB/Samba banner on port 445/tcp: OS String: Debian GNU/Linux; SM ↵B String: Samba 3.0.20-Debian

OS: Ubuntu

CPE: cpe:/o:canonical:ubuntu\_linux

Found by NVT: 1.3.6.1.4.1.25623.1.0.111067 (HTTP OS Identification)

Concluded from PHP Server banner on port 80/tcp: X-Powered-By: PHP/5.2.4-2ubuntu ↵5.10

OS: Ubuntu

## NVT: Unknown OS and Service Banner Reporting

## Summary

This NVT consolidates and reports the information collected by the following NVTs:

- Collect banner of unknown services (OID: 1.3.6.1.4.1.25623.1.0.11154)
- Service Detection (unknown) with nmap (OID: 1.3.6.1.4.1.25623.1.0.66286)
- Service Detection (wrapped) with nmap (OID: 1.3.6.1.4.1.25623.1.0.108525)
- OS Detection Consolidation and Reporting (OID: 1.3.6.1.4.1.25623.1.0.105937)

If you know any of the information reported here, please send the full output to the referenced community portal.

## Vulnerability Detection Result

```
Unknown banners have been collected which might help to identify the OS running
↳ on this host. If these banners containing information about the host OS please
↳ report the following information to https://community.greenbone.net/c/vulnerability-tests:
```

Banner:

[illegible]

<b>Summary</b> This script checks the remote VNC protocol version and the available 'security types'.
<b>Vulnerability Detection Result</b> The remote VNC server chose security type #2 (VNC authentication)
<b>Log Method</b> Details: VNC security types OID:1.3.6.1.4.1.25623.1.0.19288 Version used: \$Revision: 13541 \$

Log (CVSS: 0.0) NVT: VNC Server and Protocol Version Detection
<b>Summary</b> The remote host is running a remote display software (VNC) which permits a console to be displayed remotely. This allows authenticated users of the remote host to take its control remotely.
<b>Vulnerability Detection Result</b> A VNC server seems to be running on this port. The version of the VNC protocol is : RFB 003.003
<b>Solution</b> Make sure the use of this software is done in accordance with your corporate security policy, filter incoming traffic to this port.

Log (CVSS: 0.0)

NVT: X Server Detection

**Summary**

This plugin detects X Window servers.

X11 is a client - server protocol. Basically, the server is in charge of the screen, and the clients connect to it and send several requests like drawing a window or a menu, and the server sends events back to the clients, such as mouse clicks, key strokes, and so on...

An improperly configured X server will accept connections from clients from anywhere. This allows an attacker to make a client connect to the X server to record the keystrokes of the user, which may contain sensitive information, such as account passwords. This can be prevented by using xauth, MIT cookies, or preventing the X server from listening on TCP (a Unix sock is used for local connections)

**Vulnerability Detection Result**

Detected X Windows Server

Version: 11.0

Location: 6000/tcp

CPE: cpe:/a:x.org:x11:11.0

Concluded from version/product identification result:

11.0

NVT: CGI Scanning Consolidation

**Summary**

The script consolidates various information for CGI scanning.

This information is based on the following scripts / settings:

- HTTP-Version Detection (OID: 1.3.6.1.4.1.25623.1.0.100034)

- No 404 check (OID: 1.3.6.1.4.1.25623.1.0.10386)

- Web mirroring / webmirror.nasl (OID: 1.3.6.1.4.1.25623.1.0.10662)

- Directory Scanner / DDI\_Directory\_Scanner.nasl (OID: 1.3.6.1.4.1.25623.1.0.11032)

... continues on next page ...

...continued from previous page ...

- The configured 'cgi\_path' within the 'Scanner Preferences' of the scan config in use
  - The configured 'Enable CGI scanning', 'Enable generic web application scanning' and 'Add historic /scripts and /cgi-bin to directories for CGI scanning' within the 'Global variable settings' of the scan config in use
- If you think any of this information is wrong please report it to the referenced community portal.

### Vulnerability Detection Result

The Hostname/IP "172.17.0.3" was used to access the remote host.

Generic web application scanning is disabled for this host via the "Enable generic web application scanning" option within the "Global variable settings" of the scan config in use.

Requests to this service are done via HTTP/1.1.

This service seems to be able to host PHP scripts.

This service seems to be NOT able to host ASP scripts.

The User-Agent "Mozilla/5.0 [en] (X11; U; OpenVAS-VT 9.0.3)" was used to access the remote host.

Historic /scripts and /cgi-bin are not added to the directories used for CGI scanning. You can enable this again with the "Add historic /scripts and /cgi-bin to directories for CGI scanning" option within the "Global variable settings" of the scan config in use.

The following directories were used for CGI scanning:

http://172.17.0.3/

http://172.17.0.3/cgi-bin

http://172.17.0.3/dav

http://172.17.0.3/doc

http://172.17.0.3/dvwa

http://172.17.0.3/phpMyAdmin

http://172.17.0.3/rdiff/TWiki

http://172.17.0.3/test

http://172.17.0.3/test/testoutput

http://172.17.0.3/tikiwiki

http://172.17.0.3/tikiwiki/lib

http://172.17.0.3/twiki

http://172.17.0.3/twiki/pub

http://172.17.0.3/twiki/pub/TWiki/FileAttachment

http://172.17.0.3/twiki/pub/TWiki/TWikiDocGraphics

http://172.17.0.3/twiki/pub/TWiki/TWikiLogos

http://172.17.0.3/twiki/pub/TWiki/TWikiPreferences

http://172.17.0.3/twiki/pub/TWiki/TWikiTemplates

http://172.17.0.3/twiki/pub/icn

http://172.17.0.3/view/TWiki

While this is not, in and of itself, a bug, you should manually inspect these directories to ensure that they are in compliance with company security standards

**Log Method**

Details: DIRB (NASL wrapper)

OID:1.3.6.1.4.1.25623.1.0.103079

Version used: \$Revision: 13985 \$

Log (CVSS: 0.0)

NVT: Fingerprint web server with favicon.ico

**Summary**

The remote web server contains a graphic image that is prone to information disclosure.

**Vulnerability Detection Result**

The following apps/services were identified:

"phpmyadmin (2.11.8.1 - 4.2.x)" fingerprinted by the file: "http://172.17.0.3/phpMyAdmin/favicon.ico"

**Impact**

The 'favicon.ico' file found on the remote web server belongs to a popular webserver/application. This may be used to fingerprint the webserver/application.

**Solution****Solution type:** Mitigation

Remove the 'favicon.ico' file or create a custom one for your site.

**Log Method**

Details: Fingerprint web server with favicon.ico

Log (CVSS: 0.0)

NVT: HTTP Server type and version

**Summary**

This detects the HTTP Server's type and version.

**Vulnerability Detection Result**

The remote web server type is :

Apache/2.2.8 (Ubuntu) DAV/2

Solution : You can set the directive "ServerTokens Prod" to limit the information emanating from the server in its response headers.

**Solution**

- Configure your server to use an alternate name like 'Wintendo httpD w/Dotmatrix display'
- Be sure to remove common logos like apache\_pb.gif.

Log (CVSS: 0.0)

NVT: wapiti (NASL wrapper)

**Summary**

This plugin uses wapiti to find web security issues.

Make sure to have wapiti 2.x as wapiti 1.x is not supported.

See the preferences section for wapiti options.

Note that the scanner is using limited set of wapiti options. Therefore, for more complete web assessment, you should use standalone wapiti tool for deeper/customized checks.

Note: The plugin needs the 'wapiti' binary found within the PATH of the user running the scanner and needs to be executable for this user. The existence of this binary is checked and reported separately within 'Availability of scanner helper tools' (OID: 1.3.6.1.4.1.25623.1.0.810000).

**Vulnerability Detection Result**

The wapiti report filename is empty. That could mean that a wrong version of wapiti is used or tmp dir is not accessible. Make sure to have wapiti 2.x as wapiti 1.x is not supported.

In short: Check the installation of wapiti and the scanner.

Log (CVSS: 0.0)

NVT: SSL/TLS: Report Perfect Forward Secrecy (PFS) Cipher Suites

**Summary**

This routine reports all SSL/TLS cipher suites accepted by a service which are supporting Perfect Forward Secrecy (PFS).

**Vulnerability Detection Result**

Cipher suites supporting Perfect Forward Secrecy (PFS) are accepted by this service via the SSLv3 protocol:

```

TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA
TLS_DHE_RSA_WITH_AES_128_CBC_SHA
TLS_DHE_RSA_WITH_AES_256_CBC_SHA

```

Cipher suites supporting Perfect Forward Secrecy (PFS) are accepted by this service via the TLSv1.0 protocol:

```

TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA
TLS_DHE_RSA_WITH_AES_128_CBC_SHA
TLS_DHE_RSA_WITH_AES_256_CBC_SHA

```

NVT: SSL/TLS: Report Supported Cipher Suites

**Summary**

This routine reports all SSL/TLS cipher suites accepted by a service.

... continues on next page ...

...continued from previous page...

As the NVT 'SSL/TLS: Check Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.900234) might run into a timeout the actual reporting of all accepted cipher suites takes place in this NVT instead. The script preference 'Report timeout' allows you to configure if such an timeout is reported.

#### Vulnerability Detection Result

'Strong' cipher suites accepted by this service via the SSLv3 protocol:

TLS\_DHE\_RSA\_WITH\_AES\_256\_CBC\_SHA

'Medium' cipher suites accepted by this service via the SSLv3 protocol:

TLS\_DHE\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA

TLS\_DHE\_RSA\_WITH\_AES\_128\_CBC\_SHA

TLS\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA

TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA

TLS\_RSA\_WITH\_AES\_256\_CBC\_SHA

'Weak' cipher suites accepted by this service via the SSLv3 protocol:

TLS\_RSA\_WITH\_RC4\_128\_SHA

No 'Null' cipher suites accepted by this service via the SSLv3 protocol.

No 'Anonymous' cipher suites accepted by this service via the SSLv3 protocol.

'Strong' cipher suites accepted by this service via the TLSv1.0 protocol:

TLS\_DHE\_RSA\_WITH\_AES\_256\_CBC\_SHA

'Medium' cipher suites accepted by this service via the TLSv1.0 protocol:

TLS\_DHE\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA

TLS\_DHE\_RSA\_WITH\_AES\_128\_CBC\_SHA

TLS\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA

TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA

TLS\_RSA\_WITH\_AES\_256\_CBC\_SHA

'Weak' cipher suites accepted by this service via the TLSv1.0 protocol:

TLS\_RSA\_WITH\_RC4\_128\_SHA

No 'Null' cipher suites accepted by this service via the TLSv1.0 protocol.

No 'Anonymous' cipher suites accepted by this service via the TLSv1.0 protocol.

Log (CVSS: 0.0)  
NVT: SMB NativeLanMan

**Summary**

It is possible to extract OS, domain and SMB server information from the Session Setup AndX Response packet which is generated during NTLM authentication.

**Vulnerability Detection Result**

Detected Samba  
Version: 3.0.20  
Location: 445/tcp  
CPE: cpe:/a:samba:samba:3.0.20  
Concluded from version/product identification result:  
Samba 3.0.20-Debian  
Extra information:  
Detected SMB workgroup: WORKGROUP  
Detected SMB server: Samba 3.0.20-Debian

**Log Method**

Details: SMB NativeLanMan  
OID:1.3.6.1.4.1.25623.1.0.102011  
Version used: \$Revision: 13813 \$

Log (CVSS: 0.0)  
NVT: SMB NativeLanMan

**Summary**

It is possible to extract OS, domain and SMB server information from the Session Setup AndX Response packet which is generated during NTLM authentication.

**Vulnerability Detection Result**

Detected SMB workgroup: WORKGROUP  
Detected SMB server: Samba 3.0.20-Debian  
Detected OS: Debian GNU/Linux

**Log Method**

Details: SMB NativeLanMan  
OID:1.3.6.1.4.1.25623.1.0.102011  
Version used: \$Revision: 13813 \$

Log (CVSS: 0.0) NVT: SMB Remote Version Detection
<b>Summary</b> Detection of Server Message Block(SMB). This script sends SMB Negotiation request and try to get the version from the response.
<b>Vulnerability Detection Result</b> Only SMBv1 is enabled on remote target
<b>Log Method</b> Details: SMB Remote Version Detection OID:1.3.6.1.4.1.25623.1.0.807830 Version used: \$Revision: 10898 \$

Log (CVSS: 0.0) NVT: SMB Test with 'smbclient'
<b>Summary</b> This script reports information about the SMB server of the remote host collected with the 'smbclient' tool.
<b>Vulnerability Detection Result</b> OS Version = UNIX Domain = WORKGROUP SMB Serverversion = SAMBA 3.0.20-DEBIAN
<b>Log Method</b> Details: SMB Test with 'smbclient' OID:1.3.6.1.4.1.25623.1.0.90011 Version used: \$Revision: 13274 \$

Log (CVSS: 0.0) NVT: SMB/CIFS Server Detection
<b>Summary</b> This script detects whether port 445 and 139 are open and if they are running a CIFS/SMB server.
<b>Vulnerability Detection Result</b> A CIFS server is running on this port
<b>Log Method</b> Details: SMB/CIFS Server Detection OID:1.3.6.1.4.1.25623.1.0.11011 Version used: \$Revision: 13541 \$

Log (CVSS: 0.0)

NVT: Services

**Summary**

This routine attempts to guess which service is running on the remote ports. For instance, it searches for a web server which could listen on another port than 80 or 443 and makes this information available for other check routines.

**Vulnerability Detection Result**

An FTP server is running on this port.

Here is its banner :

220 (vsFTPd 2.3.4)

**Log Method**

Details: Services

OID:1.3.6.1.4.1.25623.1.0.10330

Version used: \$Revision: 13541 \$

Log (CVSS: 0.0)

NVT: vsFTPd FTP Server Detection

**Summary**

The script is grabbing the banner of a FTP server and attempts to identify a vsFTPd FTP Server and its version from the reply.

**Vulnerability Detection Result**

Detected vsFTPd

Version: 2.3.4

Location: 21/tcp

CPE: cpe:/a:beasts:vsftpd:2.3.4

Concluded from version/product identification result:

220 (vsFTPd 2.3.4)

**Log Method**

Details: vsFTPd FTP Server Detection

OID:1.3.6.1.4.1.25623.1.0.111050
