

Scan Report

October 23, 2025

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone “Coordinated Universal Time”, which is abbreviated “UTC”. The task was “unnamed”. The scan started at Thu Oct 23 00:33:30 2025 UTC and ended at Thu Oct 23 01:05:27 2025 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

Contents

Result Overview

Host	High	Medium	Low	Log	False Positive
172.17.0.3	19	37	3	0	0
Total: 1	19	37	3	0	0

Vendor security updates are not trusted.

Overrides are on. When a result has an override, this report uses the threat of the override.
Information on overrides is included in the report.

Notes are included in the report.

This report might not show details of all issues that were found.

It only lists hosts that produced issues.

Issues with the threat level “Log” are not shown.

Issues with the threat level “Debug” are not shown.

Issues with the threat level “False Positive” are not shown.

Only results with a minimum QoD of 70 are shown.

This report contains all 59 results selected by the filtering described above. Before filtering there were 368 results.

High (CVSS: 10.0) NVT: Distributed Ruby (dRuby/DRb) Multiple Remote Code Execution Vulnerabilities
<p>Summary Systems using Distributed Ruby (dRuby/DRb), which is available in Ruby versions 1.6 and later, may permit unauthorized systems to execute distributed commands.</p>
<p>Vulnerability Detection Result The service is running in <code>\$SAFE >= 1</code> mode. However it is still possible to run a →rbitrary syscall commands on the remote host. Sending an invalid syscall the s →ervice returned the following response:</p> <pre>Flo:Errno::ENOSYS:bt["3/usr/lib/ruby/1.8/druby/druby.rb:1555:in 'syscall'"0/usr/lib/ruby/1.8/druby/druby.rb:1555:in 'send'"4/usr/lib/ruby/1.8/druby/druby.rb:1555:in '__send__'"A/usr/lib/ruby/1.8/druby/druby.rb:1555:in 'perform_without_block'"3/usr/lib/ruby/1.8/druby/druby.rb:1515:in 'perform'"5/usr/lib/ruby/1.8/druby/druby.rb:1589:in 'main_loop'"0/usr/lib/ruby/1.8/druby/druby.rb:1585:in 'loop'"5/usr/lib/ruby/1.8/druby/druby.rb:1585:in 'main_loop'"1/usr/lib/ruby/1.8/druby/druby.rb:1581:in 'start'"5/usr/lib/ruby/1.8/druby/druby.rb:1581:in 'main_loop'"//usr/lib/ruby/1.8/druby/druby.rb:143:in 'run'"1/usr/lib/ruby/1.8/druby/druby.rb:1427:in 'start'"//usr/lib/ruby/1.8/druby/druby.rb:1427:in 'run'"6/usr/lib/ruby/1.8/druby/druby.rb:1347:in 'initialize'"//usr/lib/ruby/1.8/druby/druby.rb:1627:in 'new'"9/usr/lib/ruby/1.8/druby/druby.rb:1627:in 'start_service'"%/usr/sbin/druby_timeserver.rb:12:errnoi+:mesg"Function not implemented</pre> <p>... continues on next page ...</p>

... continued from previous page ...

Impact

By default, Distributed Ruby does not impose restrictions on allowed hosts or set the \$SAFE environment variable to prevent privileged activities. If other controls are not in place, especially if the Distributed Ruby process runs with elevated privileges, an attacker could execute arbitrary system commands or Ruby scripts on the Distributed Ruby server. An attacker may need to know only the URI of the listening Distributed Ruby server to submit Ruby commands.

Solution

Solution type: Mitigation

Administrators of environments that rely on Distributed Ruby should ensure that appropriate controls are in place. Code-level controls may include:

- Implementing taint on untrusted input
- Setting \$SAFE levels appropriately (>=2 is recommended if untrusted hosts are allowed to submit Ruby commands, and >=3 may be appropriate)
- Including drb/acl.rb to set ACLEntry to restrict access to trusted hosts

Vulnerability Detection Method

Send a crafted command to the service and check for a remote command execution via the instance_eval or syscall requests.

High (CVSS: 7.5)

NVT: PHP-CGI-based setups vulnerability when parsing query string parameters from php files.

Summary

PHP is prone to an information-disclosure vulnerability.

Vulnerability Detection Result

Vulnerable url: <http://172.17.0.3/cgi-bin/php>

... continues on next page ...

... continued from previous page ...

Impact

Exploiting this issue allows remote attackers to view the source code of files in the context of the server process. This may allow the attacker to obtain sensitive information and to run arbitrary PHP code on the affected computer. Other attacks are also possible.

Solution

Solution type: VendorFix

PHP has released version 5.4.3 and 5.3.13 to address this vulnerability. PHP is recommending that users upgrade to the latest version of PHP.

Vulnerability Insight

When PHP is used in a CGI-based setup (such as Apache's mod_cgid), the php-cgi receives a processed query string parameter as command line arguments which allows command-line switches, such as -s, -d or -c to be passed to the php-cgi binary, which can be exploited to disclose source code and obtain arbitrary code execution.

An example of the -s command, allowing an attacker to view the source code of index.php is below:

<http://example.com/index.php?-s>

Vulnerability Detection Method

NVT: rlogin Passwordless / Unencrypted Cleartext Login

Summary

This remote host is running a rlogin service.

Vulnerability Detection Result

The service is misconfigured so it is allowing connections without a password.

Solution

Solution type: Mitigation

Disable the rlogin service and use alternatives like SSH instead.

Vulnerability Insight

rlogin has several serious security problems,

- all information, including passwords, is transmitted unencrypted.

- .rlogin (or .rhosts) file is easy to misuse (potentially allowing anyone to login without a password)

Vulnerability Detection Method

Details: rlogin Passwordless / Unencrypted Cleartext Login

<p>High (CVSS: 9.0) NVT: VNC Brute Force Login</p>
<p>Summary Try to log in with given passwords via VNC protocol.</p>
<p>Vulnerability Detection Result It was possible to connect to the VNC server with the password: password</p>
<p>Solution Solution type: Mitigation Change the password to something hard to guess or enable password protection at all.</p>
<p>Vulnerability Insight This script tries to authenticate to a VNC server with the passwords set in the password preference. It will also test and report if no authentication / password is required at all. Note: Some VNC servers have a blacklisting scheme that blocks IP addresses after five unsuccessful connection attempts for a period of time. The script will abort the brute force attack if it encounters that it gets blocked. Note as well that passwords can be max. 8 characters long.</p>

NVT: TWiki Cross-Site Request Forgery Vulnerability - Sep10

Product detection result

cpe:/a:twiki:twiki:01.Feb.2003

Detected by TWiki Version Detection (OID: 1.3.6.1.4.1.25623.1.0.800399)

Summary

The host is running TWiki and is prone to Cross-Site Request Forgery vulnerability.

Vulnerability Detection Result

Installed version: 01.Feb.2003

Fixed version: 4.3.2

Impact

Successful exploitation will allow attacker to gain administrative privileges on the target application and can cause CSRF attack.

Solution

Solution type: VendorFix

Upgrade to TWiki version 4.3.2 or later.

Affected Software/OS

TWiki version prior to 4.3.2

Vulnerability Insight

Attack can be done by tricking an authenticated TWiki user into visiting a static HTML page on another side, where a Javascript enabled browser will send an HTTP POST request to TWiki, which in turn will process the request as the TWiki user.

Vulnerability Detection Method

Details: TWiki Cross-Site Request Forgery Vulnerability - Sep10

Medium (CVSS: 5.0)

NVT: /doc directory browsable

Summary

The /doc directory is browsable. /doc shows the content of the /usr/doc directory and therefore it shows which programs and - important! - the version of the installed programs.

Vulnerability Detection Result

Vulnerable url: <http://172.17.0.3/doc/>

Solution

Solution type: Mitigation

Use access restrictions for the /doc directory. If you use Apache you might use this in your access.conf:

```
<Directory /usr/doc> AllowOverride None order deny, allow deny from all allow from localhost
</Directory>
```

Vulnerability Detection Method

Details: /doc directory browsable

NVT: Tiki Wiki CMS Groupware 'fixedURLData' Local File Inclusion Vulnerability

Product detection result

cpe:/a:tiki:tikiwiki_cms/groupware:1.9.5

Detected by Tiki Wiki CMS Groupware Version Detection (OID: 1.3.6.1.4.1.25623.1. ↪0.901001)

... continues on next page ...

... continued from previous page ...

Summary

The host is installed with Tiki Wiki CMS Groupware and is prone to a local file inclusion vulnerability.

Vulnerability Detection Result

Installed version: 1.9.5

Fixed version: 12.11

Impact

Successful exploitation will allow an user having access to the admin backend to gain access to arbitrary files and to compromise the application.

Solution

Solution type: VendorFix

Upgrade to Tiki Wiki CMS Groupware version 12.11 LTS, 15.4 or later.

Affected Software/OS

Tiki Wiki CMS Groupware versions:

- below 12.11 LTS
- 13.x, 14.x and 15.x below 15.4

Vulnerability Insight

The Flaw is due to improper sanitization of input passed to the 'fixedURLData' parameter of the 'display_banner.php' script.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: Tiki Wiki CMS Groupware 'fixedURLData' Local File Inclusion Vulnerability

Medium (CVSS: 5.0) NVT: awiki Multiple Local File Include Vulnerabilities
Summary awiki is prone to multiple local file-include vulnerabilities because it fails to properly sanitize user-supplied input.
Vulnerability Detection Result Vulnerable url: http://172.17.0.3/mutillidae/index.php?page=/etc/passwd
Impact An attacker can exploit this vulnerability to obtain potentially sensitive information and execute arbitrary local scripts in the context of the webserver process. This may allow the attacker to compromise the application and the host. Other attacks are also possible.
Solution Solution type: WillNotFix No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.
Affected Software/OS awiki 20100125 is vulnerable. Other versions may also be affected.
Vulnerability Detection Method Details: awiki Multiple Local File Include Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.103210 Version used: \$Revision: 10741 \$

```

Solution

Solution type: Mitigation

Disable the weak encryption algorithms.

Vulnerability Insight

The ‘arcfour’ cipher is the Arcfour stream cipher with 128-bit keys. The Arcfour cipher is believed to be compatible with the RC4 cipher [SCHNEIER]. Arcfour (and RC4) has problems with weak keys, and should not be used anymore.

The ‘none’ algorithm specifies that no encryption is to be done. Note that this method provides no confidentiality protection, and it is NOT RECOMMENDED to use it.

A vulnerability exists in SSH messages that employ CBC mode that may allow an attacker to recover plaintext from a block of ciphertext.

Vulnerability Detection Method

Check if remote ssh service supports Arcfour, none or CBC ciphers.

Details: SSH Weak Encryption Algorithms Supported

OID:1.3.6.1.4.1.25623.1.0.105611

	Medium (CVSS: 4.8)
--	--------------------

	NVT: FTP Unencrypted Cleartext Login
--	--------------------------------------

Summary

	The remote host is running a FTP service that allows cleartext logins over unencrypted connections.
--	---

Vulnerability Detection Result

	The remote FTP service accepts logins without a previous sent 'AUTH TLS' command
--	--

	↪. Response(s):
--	-----------------

	Anonymous sessions: 331 Password required for anonymous
--	---

	Non-anonymous sessions: 331 Password required for openvas-vt
--	--

Impact

	An attacker can uncover login names and passwords by sniffing traffic to the FTP service.
--	---

Solution

	Solution type: Mitigation
--	----------------------------------

	Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.
--	--

Vulnerability Detection Method

	Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command.

Medium (CVSS: 6.4) NVT: Anonymous FTP Login Reporting
Summary Reports if the remote FTP Server allows anonymous logins.
Vulnerability Detection Result It was possible to login to the remote FTP service with the following anonymous →account(s): anonymous:anonymous@example.com ftp:anonymous@example.com
Impact Based on the files accessible via this anonymous FTP login and the permissions of this account an attacker might be able to: - gain access to sensitive files - upload or delete files.
Solution Solution type: Mitigation If you do not want to share files, you should disable anonymous logins.
Vulnerability Insight A host that provides an FTP service may additionally provide Anonymous FTP access as well. Under this arrangement, users do not strictly need an account on the host. Instead the user typically enters 'anonymous' or 'ftp' when prompted for username. Although users are commonly asked to send their email address as their password, little to no verification is actually performed on the supplied data.
Vulnerability Detection Method Details: Anonymous FTP Login Reporting OID:1.3.6.1.4.1.25623.1.0.900600 Version used: \$Revision: 12030 \$

Medium (CVSS: 4.3) NVT: SSL/TLS: 'DHE_EXPORT' Man in the Middle Security Bypass Vulnerability (LogJam)
Summary This host is accepting 'DHE_EXPORT' cipher suites and is prone to man in the middle attack.
Vulnerability Detection Result 'DHE_EXPORT' cipher suites accepted by this service via the SSLv3 protocol: TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA TLS_DH_anon_EXPORT_WITH_RC4_40_MD5 'DHE_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol: TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA TLS_DH_anon_EXPORT_WITH_RC4_40_MD5
Impact Successful exploitation will allow a man-in-the-middle attacker to downgrade the security of a TLS session to 512-bit export-grade cryptography, which is significantly weaker, allowing the attacker to more easily break the encryption and monitor or tamper with the encrypted stream.
Solution Solution type: VendorFix - Remove support for 'DHE_EXPORT' cipher suites from the service - If running OpenSSL update to version 1.0.2b or 1.0.1n or later.
Affected Software/OS - Hosts accepting 'DHE_EXPORT' cipher suites

Solution

Solution type: Mitigation

Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.

Vulnerability Insight

The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use:

- Secure Hash Algorithm 1 (SHA-1)
- Message Digest 5 (MD5)
- Message Digest 4 (MD4)
- Message Digest 2 (MD2)

Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates.

NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive:

Fingerprint1

or

fingerprint1,Fingerprint2

Vulnerability Detection Method

Check which hashing algorithm was used to sign the remote SSL/TLS certificate.

Details: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm

Medium (CVSS: 4.0)

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Summary

The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).

Vulnerability Detection Result

Server Temporary Key Size: 1024 bits

Impact

An attacker might be able to decrypt the SSL/TLS communication offline.

... continues on next page ...

... continued from previous page ...

Solution

Solution type: Workaround

Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group (see the references).

For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.

Vulnerability Insight

The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.

Vulnerability Detection Method

Checks the DHE temporary public key size.

Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Medium (CVSS: 4.3)

NVT: SSL/TLS: Report Weak Cipher Suites

Summary

This routine reports all Weak SSL/TLS cipher suites accepted by a service.

NOTE: No severity for SMTP services with 'Opportunistic TLS' and weak cipher suites on port 25/tcp is reported. If too strong cipher suites are configured for this service the alternative would be to fall back to an even more insecure cleartext communication.

Vulnerability Detection Result

'Weak' cipher suites accepted by this service via the SSLv3 protocol:

TLS_RSA_WITH_RC4_128_SHA

'Weak' cipher suites accepted by this service via the TLSv1.0 protocol:

TLS_RSA_WITH_RC4_128_SHA

Solution

Solution type: Mitigation

The configuration of this services should be changed so that it does not accept the listed weak cipher suites anymore.

Please see the references for more resources supporting you with this task.

Vulnerability Insight

These rules are applied for the evaluation of the cryptographic strength:

- RC4 is considered to be weak (CVE-2013-2566, CVE-2015-2808).
- Ciphers using 64 bit or less are considered to be vulnerable to brute force methods and therefore considered as weak (CVE-2015-4000).
- 1024 bit RSA authentication is considered to be insecure and therefore as weak.
- Any cipher considered to be secure for only the next 10 years is considered as medium
- Any other cipher is considered as strong

Medium (CVSS: 4.3)

NVT: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability (POODLE)
--

Summary

This host is prone to an information disclosure vulnerability.
--

Vulnerability Detection Result

Vulnerability was detected according to the Vulnerability Detection Method.

Impact

Successful exploitation will allow a man-in-the-middle attackers gain access to the plain text data stream.

Solution

Solution type: Mitigation

Possible Mitigations are:

- | |
|---|
| - Disable SSLv3 |
| - Disable cipher suites supporting CBC cipher modes |
| - Enable TLS_FALLBACK_SCSV if the service is providing TLSv1.0+ |

Vulnerability Insight

The flaw is due to the block cipher padding not being deterministic and not covered by the Message Authentication Code
--

Vulnerability Detection Method

Evaluate previous collected information about this service.

NVT: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm

Summary

The remote service is using a SSL/TLS certificate in the certificate chain that has been signed using a cryptographically weak hashing algorithm.

Vulnerability Detection Result

The following certificates are part of the certificate chain but using insecure
 →signature algorithms:

Subject: 1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D626173
 →652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for Complic
 →ation of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no such thi
 →ng outside US,C=XX

Signature Algorithm: sha1WithRSAEncryption

Solution

Solution type: Mitigation

Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.

Vulnerability Insight

The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use:

- Secure Hash Algorithm 1 (SHA-1)
- Message Digest 5 (MD5)
- Message Digest 4 (MD4)
- Message Digest 2 (MD2)

Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates.

NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive:

Fingerprint1

or

... continues on next page ...

	... continued from previous page ...
fingerprint1,Fingerprint2	

Vulnerability Detection Method

Check which hashing algorithm was used to sign the remote SSL/TLS certificate.

Medium (CVSS: 4.0)

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Summary

The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).

Vulnerability Detection Result

Server Temporary Key Size: 1024 bits

Impact

An attacker might be able to decrypt the SSL/TLS communication offline.

Solution**Solution type:** Workaround

Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group (see the references).

For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.

Vulnerability Insight

The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.

Vulnerability Detection Method

Checks the DHE temporary public key size.

Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

NVT: UnrealIRCd Authentication Spoofing Vulnerability

Product detection result

cpe:/a:unrealircd:unrealircd:3.2.8.1

Detected by UnrealIRCd Detection (OID: 1.3.6.1.4.1.25623.1.0.809884)

Summary

This host is installed with UnrealIRCd and is prone to authentication spoofing vulnerability.

Vulnerability Detection Result

Installed version: 3.2.8.1

Fixed version: 3.2.10.7

Impact

Successful exploitation of this vulnerability will allow remote attackers to spoof certificate fingerprints and consequently log in as another user.

Solution

Solution type: VendorFix

Upgrade to UnrealIRCd 3.2.10.7, or 4.0.6, or later.

Affected Software/OS

UnrealIRCd before 3.2.10.7 and 4.x before 4.0.6.

Vulnerability Insight

The flaw exists due to an error in the 'm_authenticate' function in 'modules/m_sasl.c' script.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: UnrealIRCd Authentication Spoofing Vulnerability

Low general/tcp

<p>Low (CVSS: 2.6) NVT: TCP timestamps</p>
<p>Summary The remote host implements TCP timestamps and therefore allows to compute the uptime.</p>
<p>Vulnerability Detection Result It was detected that the host implements RFC1323. The following timestamps were retrieved with a delay of 1 seconds in-between: Packet 1: 246103389 Packet 2: 246104428</p>
<p>Impact A side effect of this feature is that the uptime of the remote host can sometimes be computed.</p>
<p>Solution Solution type: Mitigation To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime. To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled' Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled. The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment. See the references for more information.</p>
<p>Affected Software/OS TCP/IPv4 implementations that implement RFC1323.</p>

... continues on next page ...

... continued from previous page ...

Vulnerability Insight

The remote host implements TCP timestamps, as defined by RFC1323.

Vulnerability Detection Method

Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported.

Details: TCP timestamps
